SB RTTYDX @ ALLBBS $RTDX1026
RTTY DX Notes 1of3 10/26/90

RTTY DX Notes for week ending 26th October 1990
BID: $RTDX1026
Part 1 of 3.

Looking at the reports being received, indications are that the higher
bands (21 and 28 MHz) are showing greater activity of late. Maybe it
behoves us to pay more attention to these bands at the present, and in
the future, it could prove interesting for the good DX.

Our thanks this week go to I5FLN and cluster, JA1BLV, OD5NG, TG9VT,
UT5RP, VE3OCX, VK2EG, W6/G0AZT, W2JGR and the Tri-State DX Packet
Cluster Network. Thank you all for your information. Unfortunately I
could not use it all, but I hope that I have given you the best of it.

SB RTTYDX @ ALLBBS $RTDX1026B
RTTY DX Notes 3of3 10/26/90

RTTY DX Notes for week ending 26th October 1990
BID: $RTDX1026B
Part 3 of 3.

QSL Information:

All cards for UA3TT/whatever go to Box 18, Gorky 603000, USSR.

Z21GU says to QSL via callbook address.

FW1FM will QSL via Box 20, Futuna Island.

9J2BO QSL manager is W6ORD.

ZD7JAM and the scouts will QSL via Box 54, St Helena Island.

3DA0BW and 3DA0BX will QSL via Box 57, Big Bend, Swaziland.

RA2FB indicates that Box 261, Sovetsk, 238700 USSR is his QSL address.

CY9CF says to QSL via Box 4204, F-97500, St Pierre Et Miquelion Island
via Canada.

Notes Of Interest:

OH2BGD reports that he will be QRV from PJ9W after the CQWW Contest.
He will operate RTTY on 28, 21 and 14 MHz, usual frequencies.

HK0TU should show up around 3rd November all bands 1.8 to 28 MHz, QSL
via HK3DDD.

ZK3KY says that she will operate from T33 (Banaba), maybe this week.
Also OH2BH will operate from Banaba with the call of T33T from 7th
November to 21st November. QSL to OH3GZ.

CE0ZZZ is still expected mid November according to F2JD, who will be
the operator.

ZD7JAM and 5B4LSG/J were Jamboree stations, but they still count as
new countries.

And now for the Rumor Department. WA4JQS has been quoted as saying
that the VP8SSI and VP8SGI DXpedition has been postponed, because of
the Middle East crisis and the high cost of fuel. Maybe they will try
for somewhere else later.

Also it is believed that XU land may be activated in the foreseeable
future. Keep your fingers crossed.

GL DE DX1 (VK2SG) AT TG9VT.

Well, it certainly won't be CBS or the manufacturers of cellular phones
who will be informing them, that's for sure!

The ECPA was a handout to the cellular industry to give them a law
that they could point to and say ,"Gosh, Mr. Consumer, how can the phone
be tapped, it's ILLEGAL!"

I note with interest that the Radio Shack series of scanners locks out
cellular phones, but it does not lock out several other frequency ranges
also off limits by the ECPA. Hmm, wonder why that is? Could it be that
they make a lot of money selling cellular phones that could be affected
by scanners that can receive them???

NAAAAHHHH!!!!

2429. Magnetic Loop Antennas

Newsgroup: rec.ham-radio
Date: 1990-10-27 17:37:11 UTC
From: raina@CompSci.Bristol.AC.UK
Message-ID: <1594@csisles.Bristol.AC.UK>
Source record: 7289

I have come across a glossy flier on an HF Magnetic loop antenna
manufactured in the UK by CAP. CO Electronics.
Among the features claimed are :-

* SWR of 1.4 to 1 at the very least, 1.1 to 1 on most bands.
* doesn't require an ATU.
* occupies only 80cm to 4m of space
* bandwidth from 3kHz ro 50kHz.
* very pricey, around $600.
* ...

Being a flat-dweller and rather unsettled (I tend to change flats very
frequently), it seems to be ideal for DXing, which I miss at the moment.
CAP. CO claims that as compared to a beam 60 to 80 ft long, thir antenna
is only 1 to 1.5 S units down on 20/15/10 metres.

Is there anyone out there who has had the (dis/)pleasure of using one of
these? If so I would very much like to hear you experiences.

Tnx, 73's

Not a bad idea. When I bought my current - 1 house back in Texas,
I knew at the time I bought it that I wanted to put in a satellite
dish (cable hadn't reached there yet). So I made it a condition
of the sale that all restrictions and covenants were to be supplied,
and if there had been any antenna/dish restriction applied to the
property anywhere & anytime the sale would be void at my option.

I think this fallacy has been beat on enough times, but CW is neither
spectrally efficient nor as fault tolerant as the DSP based data modes.
Frankly, it isn't that much more efficient than SSB, and the advantage in
a Rayleigh fading environment is questionable.

Hmmm.. Not according to the schematic I have in front of me. But, they may have added that later as an option...

>When I visited 6 land, I found FAR LESS usage of all the repeaters. I guess
>everyone was hiding on the closed repeaters and simplex frequencies.

It really depends on the individual repeater, but on most of the 2m machines out here, you can find someone yacking away at just about any hour of the day or night.

>PL/CTCSS does not consitute a closed repeater.

Only if you have a copy of the repeater directory. But frankly, I consider PL to be good engineering practice, in any event.

>An "open" repeater does not mean there cannot be access controls. You can
>put on those controls, and then tell MOST people how to access. Just don't

Sorry - "RY" was used in the old time Teletypes (trademark). It gave
you an alternating bit sequence in the Baudot code. Note sure why
cw uses "V"? (maybe as a procedural sign ST? Send Test?)

>...but that's closing the repeater, Phil!

Either there is more than one kind of "open" (the way I think of it) or
there is more than one kind of closed. I will described FOUR kinds of
repeaters and let YOU label the MIDDLE two:

1. This repeater can be used by anyone. There are no access mechanisms
of any kind. If you transmit on the input, the repeater will bring
up its transmitter and retransmit your audio.

2. The owner(s)/operator(s) have indicated that anyone may use this
repeater despite the fact that it has access control mechanisms
such as CTCSS and/or DTMF. The CTCSS tone frequency and/or the
DTMF access code sequence are published for anyone to obtain and
are freely spoken over the repeater itself.

3. The owner(s)/operator(s) have indicated that anyone may use this
repeater unless they prove to be a serious nuisance by means of
poor operator practice, or operate illegally using the repeater.
The access mechanisms are periodically changed at regular intervals
and also when a serious violation occurs. The users are informed
of the changes by other means. If DTMF access is used, it might
even be the case that each user has a DIFFERENT access code.

4. The owner(s)/operator(s) discourage anyone but a limited group to
use this repeater, and have in place effective access mechanism to
prevent ordinary amateur radio operators from being able to achieve
access to the repeater. Membership is the groups is also controlled.
I am not attempting to distinguish why this repeater is this way.

Now let's label these. I have insert my *GUESS* as to what N9FZX would
label them as. Please correct me if I am wrong. If there are other
examples of repeater situations you believe need to be labeled, by all
means mentioned them; I know there are others.

KA9WGN N9FZX

1. open open
2. open ?
3. open ?
4. closed closed

>No problem. Only, don't gripe if the "local option" promply ignores that
>suggested bandplan..

I believe that once a frequency is coordinated in terms of interference
avoidance to a particular local area, the actual USE of that coordination,
i.e. to whom/what it is "assigned" should be decided upon by ONLY the hams,
and by ALL the hams affected, in the local area. If they decide later that
this assignment should CHANGE, the wider coordinating body that determines
the interference and other technical aspects of the coordination would have
nothing to do with the changes (besides record them for contact purposes).

>on the CB. :-)
>[really heavy handed sarcasm about spelling omitted]

Oh come on, lighten up. Yes I see the smiley, but you're being pretty
patronizing. The man said a Morse endorsment was irrelevant to doing
RTTY with his C64 (an opinion I share). Get a grip... and moaning
about other people's spelling isn't really helping your cause. So he
can't spell; at least he can construct a rational arguement. Ad hominem
attacks are the tactic of someone who can't.

For what it's worth, I wrote (and passed, thanks be to the NetGhods)
my first Morse element yesterday afternoon. I'm not suddenly filled
with a wild desire to pound brass. I *will* do it though, so I can
pass my second Morse element. Maybe in time I will come to enjoy it.
I don't know yet. But it sure is coercion, it meets every criterion
for that label.

Yours for private choice, whatever that may be (and there's nothing
wrong with using and enjoying A1, I greatly respect it as a neat
skill *for those who want to use it*, it's just that the proficiency
requirement is arbitrary).

2436. Repeaters

Newsgroup: rec.ham-radio
Date: 1990-10-27 21:19:29 UTC
From: luru@stekt.oulu.fi
Message-ID: <LURU.90Oct27221929@stekt.oulu.fi>
Source record: 7296

I am not all that familiar with the repeater system (frequency allocations, ownership, etc.) in the U. S.

I am especially puzzled with the concept of "open" and "closed" repeaters and how the latter fits in the picture of amateur radio. Can someone please clarify this terminology for me?

As far as I understand it, there are a multitude of "private" repeaters. What's the point in having a dozen repeaters in a questionable QTH (and limited range) in comparison to ONE good repeater in a high (broadcast) tower or similar? Or ARE they actually all that good?

What would you say is an average working range of a typical repeater in Ohio, or any other place with flat terrain?

In here, ALL repeaters are club-owned and completely unrestricted for any user. There are currently seven (7) allocated repeater channels on 2 meters (145.600 - 145.775, 25 MHz raster) and they seem to be enough.

Am I missing something here?

Thanks,

Luru

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

A friend and I are very interested in doing this also. A short "howto"
with some very specific info would be greatly appreciated and perhaps of
general interest to the readers of this group. We would recieve to IBM
PC computers.

Thanks for the help! :-)

> could be built...

You missed the point. On our side of the argument, photographic evidence of the way structures like towers and trees actually fall down would be an excellent defense against the "from the base across the property line" restriction. In most cases, trees and poles and antennae fall within the property on which they are planted, unless pieces break off of them.

It belongs to Federal and Military services. The 3-letter,
1-number style of callsign is frequently found in aviation related
stations.

2441. -9 V from +13.6 V

Newsgroup: rec.ham-radio
Date: 1990-10-27 22:01:04 UTC
From: Pete_Simpson@dgc.ceo.dg.com
Message-ID: <9010272301.AA00019@rtp40.dg.com>
Source record: 7301

CEO summary:
The way I've always seen it done (for low current needs, like RS-232) is to use a 555 and run the output through a driver transistor, then through a capacitor, so as to differentiate the square wave, giving positive and negative spikes. A diode passes the negative ones into a capacitor, which eventually builds up a negative voltage, which you can regulate with a zener, if you so desire.

> suppose it helps CW listeners calibrate, too.

Half right. The RTTY calibration signal was (is) RYRY because
of the way the mechanical teleprinters operated. VVV is commonly
understood to mean "test" and is used as a frequency marker. Some HF
stations use CQ as a frequency marker.

> *assuming* that a majority of hams intend to use it as an excuse
> to use those frequencies regularly. Admittedly, there may be

Not a majority of all hams, but many who have the capability do
indeed use it when _they_ think it's OK. Emergency or not. On the
flipside, there are a great many non-hams with modified ham equipment
in regular, daily use on non-ham frequencies.

> some serious doo-doo, and deservedly so. No group as large as

Agreed on both counts.

> Let me put it another way. I would rather risk being fined
> by the FCC and/or losing my ham ticket than to face a lawsuit for
> negligence by the persons family for having let him die by the side
> of the road when I could have called for help. Worse than that,

How many "civilians" are knowledgeable enough about radio to
even _think_ of suing you for that? Most people who are not into
radio have no concept of what radio is or does, or how many devices
they use that incorporate RF technology.
On the other hand, a very large percentage of hams don't have a
clue as to what goes on outside the amateur bands. Should they be
required to know what is beyond the boundaries of the 2 meter band?
Of course not. I am merely making the point that there are varieties
of ignorance and that one should not assume that an expert on one
subject is knowledgeable on others.

> spending the rest of my life knowing that I might have been able
> to call for help and didn't.

This is probably a more pertinent consequence of failure to act.
Any comment that I or anyone else could make on this would be
meaningless. It is an individual decision.

> I think the assumption that hams, as a group, are sitting around
> with modified HT's eagerly in hand just WAITING for something as
> an excuse is damned insulting. I suspect that *MOST, NOT ALL*
> of us have a bit more common sense than that.

On this we agree. As a group, ham operators are more sensible
than that. But there are those who behave exactly as described above.
I just don't believe in encouraging them, or sitting by idly while
they try to persuade the more sensible that they can justify it.

> Amateur Radio
> operators have always been there when the chips are down and a
> community is hurting due to floods, fires, earthquakes, tornados,
> hurricanes or whatever disaster you can think of. The benefit

Let's not get carried away with our "emergencies." A
community-wide disaster is a different situation from a traffic
accident. As I pointed out in a previous posting (and it is even more
apropos in response to the above) our value as amateur operators as a
reserve communications resource to our communities has been based on
handling disasters like you enumerated, not on our ability to make our
radios transmit on police/fire/EMS/whatever frequencies.

> Amateur Radio is a proven one - so if the individual ham can
> show to the governing authority that he can communicate with them
> in such an emergency, on the spot, and (this is important) abide
> by whatever restrictions they set, what is wrong with that?

Nothing. But that type of situation was not what was being
discussed here. If you have permission and have worked out a formal
arrangement, then there is no issue. Except possibly Type Acceptance
depending on what you are using for a transmitter.

> David, you seem to have an axe to grind against involving
> Amateur radio in public service activities. I read your posting

Not against involving amateur radio, but in the way some (not
ALL, or even MOST) hams want to be involved.

> about doing things like taking the 2-meter band and/or the 440 band
> away from hams and giving it up to public service, etc. ad
> nauseum.

I got two or three thoughtful responses from people who had
positive things to say about alternative solutions to the spectrum
crisis that precipitated that posting. The rest were "they can't do
that because..." and "how dare you!" type useless messages. That kind
of approach will not and did not keep FCC (or nations convening a
WARC) from reallocating spectrum that we hams would rather keep to
somebody else.

> At the risk of creating yet another flame war on this newsgroup,
> perhaps you could explain why you seem so opposed to ham operators
> being involved - perhaps it would clarify "where you're coming
> from".

Fair enough. To help avoid a "flame war" I will begin with a
disclaimer. This is not an indictment of amateur radio as a whole. I
am presenting my opinions that are based on some local experiences. I

do recognize that the situation is far better in other communities and my experiences should not be used as a reason to impair other hams' efforts to become legitimately involved in public service.
Several members of the local ARES/RACES group (they are one and the same hereabouts) believe that amateur involvement in public service activities should include some degree of actually "running the show." While the RACES RO manual and various articles and publications put out by ARRL state plainly that the amateur's function is strictly relaying communications, a few of these folks believe otherwise.
I was Disaster Communications Chairman for my local Red Cross chapter for about 2 years. To the chagrin of ARES/RACES leadership, the agreement between ARRL and the American Red Cross allows the Red Cross to appoint its own volunteers. Since I wasn't the person preferred by the local leadership, I got little or no cooperation.
During one major incident (an evacuation caused by a chemical plant fire), the EC/RO decided that he would shut down the net and send his people home. The Red Cross (the paid staff, volunteer leaders and myself) had not finished our operation or released the ham communicators. The County reps had not finished with them, either. A few cooperative hams volunteered to stay with us and keep passing tactical traffic until we no longer needed them.
Those few hams are the ones who really demonstrated the usefulness of ham radio, not the officious "officials" of the formal group.
ARES/RACES in my area has not been invited to be involved in the backup Public Safety communications plans. Their "rules" are too restrictive for police/fire/EMS needs and local government has found ways to provide needed services without them. Note that I put rules in quotes; Part 97 isn't the problem.
By the way, I speak not only as a licensed ham (NF2G) but as an experienced Public Safety Dispatcher for an area with a population of approximately a half-million people.
I don't want a big fight to start over this. These are local conditions and I don't apply them to the situation in general.
Besides, I have not been actively involved in ARES/RACES in about 5 years, so maybe the leadership and attitude have changed. I hope so.

I know of one ham/ sophisticated Mensa SWL who lives in Dallas where
they have begun to do the same thing who has been very successful at
reprogramming a junk trunked radio to follow conversations and scan the
various services (all of them, not just the ones they want you to hear
and give you a radio set up for if you are lucky). He has disassembled
the microcode and patched it to handle the message formats for the
systems in use in his area.

I am convinced that a cheap 80X86 laptop could be easily
programmed to control a R-7000 or two to do the same thing and also
other naughtiness such as following cellular calls from cell to cell.
All it takes is some simple mods to the radio to make it capable of
copying 10 kbs +- 4 khz deviation fsk which is pretty universally used
as the signalling format and the appropriate interface to the laptop
to read the packets. The rest is 'just' software.

If my friend in Dallas had more time and business sense or
if I did myself one of us could build and sell a 8751 based box that clips
onto a scanner discriminator and reads, error corrects, and ships
out a serial port in ASCII the signalling packets. This would make
software to control a scanner pretty trivial. Unfortunately the
number of software controllable scanners is limited although many
can be modified to be by someone patient and skilled enough.

So a business opportunity await the first bloke who builds and markets
such a device and offers software to allow a radio to follow the
standard trunking systems in use.

Of course nothing within the resources of any private listener
save bribing the man who distributes the keys can render DES encryption
systems listenable.

I think we all have to accept that eventually (maybe even soon):

1. Almost everything of much general interest will be encrypted
securely enough so that only stupid key management will render it vulnerable.

2. What isn't encrypted will be massively illegal to listen to and people will really be going to jail and having their equipment confiscated for trying. Simply enforcing a broad construction of the the present ECPA as it stands would go pretty far in this direction.

3. Scanners and other general converage radios will become contraband, illegal to possess regardless of what they are actually tuned to. This is the only way that enforcing an anti-listening ("privacy") law could possibly be practical, as the actual act of listening is so passive, private, and undetectable.

4. The public will be assured that now everything is illegal and the laws are being enforced that their unencrypted communications are quite safe (such as cellular phones), and private individuals will be slow to actually use available security technology. As a result both criminals, and the shadier side of law enforcement will be happily able to monitor private individuals for very questionable purposes well into the forseeable future.

Yes, you do...you did in the message that started this war, and you did in your replies to me. Now that you realize that your conditions don't apply to the whole world, how about lightening up?

I tend to agree with this. Teaching in the college of engineering here, we don't tend to have too many females in our classes. So when we DO have female students, the he/she problem is even more pronounced. I tried to side step it for awhile, but the English language simply isn't equipped to handle it. If I make a statement like

"You _____ have to be careful with your power supply bypassing when you combine 555 timers with other circuit elements because the 555 uses a big slug of current when it switches."

then what is suitable for the underline pronoun? You people ... sounds somewhat derisive (at least to me). You EEs isn't right because we have both EEs and CS majors. You DWEEBS had kind of a nice ring, but students complained that I was talking down to them :-) ... You STUDENTS sounds REALLY funny. So I've just settled back into "You guys". The first few times I say it I look straight at the female class members to make sure that they know there isn't any gender discrimination, but I'm using "guys" as a collective "engineering student" name. I guess I could use "you girls" but that IS sexist, being a derisive collective name used by Coaches and Drill Instructors (both the scum of the earth, IMHO) to deride a group of males.

If anyone has any reasonable, non-flame suggestions on phrases to use, I'd be interested...

What you heard was WWCR, a licensed shortwave station in Tennessee, which has sold airtime on Sunday nights to the people that had operated the pirate RNI when it was broadcasting in International Waters off the New England coast several years ago. Alan Weiner was (is) the major driving force behind the station, and has been involved in several other pirate operations in the past. As you observed, they are now just buying airtime on Sundays (0100-0400gmt) to air their programs and to sell their material (e.g. video tapes of their ship being raided by the Coast Guard and FCC)

I agree that deleting Novice and Tech is a mistake, but I don't think it will result in opening up hundreds of Megahertz of spectrum for commercial use. It may well turn 6 and 2 meters into dying bands with decreasing usage as the old timers die off. It may reduce the number of HF amateurs. But HF and 6 and 2 are not the majority of our spectrum. They are merely the most over-used part of our spectrum.

>language. And of course the accents are gone (unless you consider fist).

Q codes help the "communications process" along but they do not communicate ideas. I consider true communication more than signal reports and QSL cards. To have a meaningful exchange of ideas with another person, you must share a common language that can comvey your thoughts to the other person. If all you are thinking about is DXCC, then I guess that CW abbreviations of English communication terms and Q signals are enough. I consider that a pitifully small subset of the topics that I would want to talk about.

A mystique has grown up around the CW modulation method and the series of shortcuts and signals that are not part of Morse per se, but are generally used by CW ops, such that many people can't see the forest for the trees. I can type "CUL OM" or PSE QSY U5" as easily as I can send it using CW and the operator on the other end would understand it as well whether we used the CW modulation method or not. The CW modulation method has it's place in amateur radio, but it's still not a LANGUAGE. Some of the shortcuts and Q signals are a language, but they form a very limited language designed to facilitate radio communications. Try thinking about an abstract subject without siliently using words; you can't. Natural language is the tool we use to give concrete form to our ideas. It's not just a spoken representation of what we think, it is what we think.

2450. basic antenna lesson needed

Newsgroup: rec.ham-radio
Date: 1990-10-28 12:55:05 UTC
From: BNHIRSCH@WEIZMANN.BITNET
Message-ID: <9010281311.AA18576@ucsd.edu>
Source record: 7312

Dear Info-Hams,

I have an antenna question. What am I doing wrong? I am trying
to build a dipole antenna for a shortwave radio that will enhance
my reception in the 19 meter band. I am currently living
in Israel in a heavy concrete building. I have a book on shortwave, which
has a short chapter on antenna theory. I cut two 15.25 foot lengths of
10 gauge comon house wire, stripped it and affixed it about 0.5 inches
off the building with plastic insulators. At the center of the
antenna I soldered a 10 meter length of co-axial cable, which I think
is 58 Ohm. I then ran the coax to the antenna jack in the back of the
radio. When I switch the antenna switch setting to external everything
goes quiet (ie no static or reception). The antenna appears to be isolated
from the building. I have also tried grounding the outer portion of the
coaxial cable with no improvement.

Any help would be much apreciated. Thank you in advance.

+---------------
| >>>>CW is the FUNDAMENTAL TRADITION of Amateur Radio. Without it you ain't no
| >>>>ham.
+---------------

Gee, that's funny... I see in the five fundamental principles of amateur radio no mention of the retention of CW as an active mode. I suppose it's time to petition the FCC to correct this oversight?

You may like CW, I like CW, but that does not mean that CW or any other so-called "FUNDAMENTAL TRADITION" should be forced down everyone's throats.

(Why, oh why, am I writing this? I persist in expecting rationality from people when I should know by now that everyone expects their own beliefs to be the ultimate law for all others. [For the sarcasm-impaired: HEAVY sarcasm.])

2453. Antennas: values for load coils?

Newsgroup: rec.ham-radio
Date: 1990-10-28 16:46:29 UTC
From: geertj@philica.ica.philips.nl
Message-ID: <697@philica.ica.philips.nl>
Source record: 7315

I have a question regarding antenna technology, one of the areas of
Amateur Radio I don't know very much about. I hope someone can give
me some insight:

I have some superreg receivers, to be used during a fox hunt. They are
built for 2m. Each one consists of a box with two 1/4 lambda antennas
(symetrical fed):

```
50 cm _____ 50cm
---------------| |---------------
| |
| |
-----
```

For a couple of reasons, I want to change these boxes for usage on 6m.
Changing the receiver itself is no problem. making the antennas work is
a problem: if possible, I want to use the same antennas. 1/4 lambda antennas
for 6 meter become a problem to handle (3 meters long!).

I am thinking of adding a coil in series with each antenna wire in the box.
I think this has been done before (CB antennas come to mind).

Question rises if this is a Good Idea:
1. What value should these coils have? How do I find these values?
2. Will a base-loaded antenna like this still work for direction finding?
3. Other things to look out for?
4. Better approaches?

The idea is that I can change the receivers back to 2 meter when our
special 6m license expires. That is one of the reasons not wanting to
change the antennas.

I hope you can help me out. Thanks in advance,

When I was wanting to get started in the satellite photo hobby, I found this article useful. Perhaps those of you who have been asking about info lately will also find it to be of interest. Many thanks to the original author(s). I finally decided to buy commercially available equipment made by Vanguard Labs. I am using the Multifax software from Schwittek. I have found that I'd like to get full 8 bit resolution which Multifax doesn't support. At some point in the future, I plan to locate and utilize software that will support 8 bit resolution, but am presently too pre-occupied with other things.

One final note that I feel I must add is that I am deeply indebted to the late Eric Roskos for his kindling of my interest in this exciting hobby. Eric's postings of his wonderful 8 bit resolution photos at the FTP server VMD.CSO.UIUC.EDU in the directory PHIL.515 stimulated my original interest. Eric also was very responsive and helpful by answering the many questions a beginner like me had at the outset. Until his untimely death late this last summer, Eric continued to be a source of information and inspiration to the lot of us who shared his interest in observing the Earth from afar. I hope Eric has a delightful view of it now.

----------cut here----------

HOW TO RECEIVE APT PICTURES FROM THE NOAA SATELLITES

So you have decided you want to receive the NOAA and Russian METEOR orbiters and you have a radio that receives 137.500 MHz and a computer. So now what do you do? I hope this short dissertation will steer you in the correct direction.

To display a picture from the orbiting birds you need several things. First you need to 'acquire' the satellite. This means you need the program to calculate its position at any time and determine if you can hear the signals from the 'bird'. The best place to get this program is probably AMSAT-NA an organization dedicated to AMateur SATellites. They have several very good tracking programs for the IBM and also for Commodore and Apple as well. After you have acquired the program and have it running on your computer, you then need the Keplerian Elements for the NOAA satellites. These elements as well as some tracking programs are available from the CELESTIAL RCP/M, run by TS Kelso, at 513-427-0674 (Fairborn,OH) and from the Weather Fax and Remote Imaging DATALINK BBS run by Dr. Jeff Wallach, N5ITU as bulletins for some 80 + sets of satellite data. Another bulletin also tells you to what the printed numbers correspond so you can enter them into the computer

program. Use the newest elements you can find as the orbiting satellites are subject to forces which change their orbits. If you use Keplerian Elements more than 3 or 4 weeks old, your chances of hearing the bird are reduced.

Once you are tracking the birds you should hear them on your receiver. They will be on 137.62 (NOAA-11), 137.500 (NOAA-10), 137.850 (Meteor 3-2), 137.4 (Meteor 2-16), 137.3 (Meteor 2-17 and 2-18). Now comes the first thing different about NOAA orbiters. The frequency deviation of the FM transmission is about +/-18-20 kHz. This is 4 times the normal deviation of a police call and 1/3 the deviation of the FM broadcast band FM signal. If you receive the signal on the regular communications width of the scanner the light areas of the picture will be noisy and the signal will sound distorted and the picture will basically be useless. If you use the FM broadcast bandwidth (assuming your scanner will let you), the signal will be weak and there may be too much background noise to see the picture.

So what now ? Well there are two ways to fix the problem, find a receiver with the proper I.F. bandwidth filter of 50 kHz, or modify the I.F. of your scanner to about 50-80 kHz. The simplest mod which has been found to be workable is to remove the narrow communications I.F. filter and replace it with a 0.01 uFd capacitor. This provides for good Wefax pictures from GOES and pretty fair NOAA orbiter pictures. It can of course result in retuning the radio, voiding the warranty and making the squelch not work properly.

The other characteristic of the NOAA satellite transmissions is THEY ARE WEAK. To get good pictures over a large area we have found a pre-amplifier to be essential. A GaAs-FET type can be obtained from various sources at a reasonable price but still about 50-100 dollars. You can also build one for about 25 dollars from plans for a pre-amp for the 2-meter amateur band and tune it to 137.5 easily.

Lastly, but importantly, the antenna can be of an omni directional, uniform pattern type such as a turnstile antenna similar to those used in the FM broadcast reception business but of course tuned to 137.5 MHz. Mount the pre-amp at the antenna if possible. Crooked coathangers on broomsticks have been known to work, and it is not difficult to build the antenna. Of course 2-meter beams with Az/El tracking will do the job well.

Now that you have a nice audio signal from the satellite, what happens next? The audio tone of 2400 HZ which is the carrier tone that is used to carry the picture information (video), must be detected and the video data converted from analog to digital and then displayed on the computer monitor by the software. The hardware and software to do this is available from several sources with more coming along. Several stand-alone boxes are also available that produce some form of computer output either in printed form or on the display. In addition the people on the DATALINK BBS may also have some data to share with you regarding this equipment.

One of the best sources for information is the WEATHER SATELLITE HANDBOOK available from Dr. Ralph Taggart of Michigan State University at 602 S. Jefferson, Mason, MI 48854 for $15.00. Taggart also writes the monthly WEATHERSAT column which appears in '73 Magazine. A must is THE JOURNAL OF THE ENVIRONMENTAL SALELLITE AMATEUR USERS' GROUP - JESAUG - which is published quarterly. It is available for $30.00 per year from the editor, Jeff Wallach, PO Box 117088 Carrollton, TX. 75011-7088 Back issues of the JESAUG are also available.

At the present the simplest software for the IBM is the Elmer Schweittek MULTIFAX software. A hardware kit is available from A&A Engineering which includes the video dectector circuit and A/D converter. Input to the PC is via the game port. If you want to build your own, complete documentation to build an interface circuit on an IBM PC prototyping board is available from H. Paul Shuch, N6TX, for $6.00 - FAXBOARD.

The WEPIX(tm) software and hardware is available from Encomm. It will produce pictures of 1200 lines by 800 samples per line displayed at 640 x 350 pixels in 16 shades of gray or 16 colors using an IBM PC with 640kB, EGA card and at least one 360k disk.

| >Olde Phartes Bookshoppes) to see that HO is used by Panama. See, you
| >don't have to guess, you can actually find out the answer and post that.
|
| It's even easier than that. The table of international prefix allocations
| appears in at least five places that I know of:
|
| o ARRL log books, as Derek mentioned
| o The North American Callbook
| o The International Callbook
| o The DXCC Countries List
| o The ARRL Handbook
+---------------

Not to mention the back of the Gordon West/Icom "HF Band Limits" card, which I got with my Tech/General theory set and keep next to my radio. I don't have to ask, just look it up in the chart.

Someday I may arrange for something to make this even more handy, ex. a Mac DA (small app. if/when System 7 comes out (hint, hint)). But for now I use the chart with no problems. (Then again, a sloping dipole with a max. height of 25 ft. and mostly in the shadow of a building does not make for a DX hunter.) (On the other hand, there's been an impressive number of DX calls on my backup 10m sideband rig the past few days. No doubt the CQWW sideband contest is partially to blame [;-)] but I still can't believe I'm hearing them. If I cared about contesting I might try contacting them....)

As quoted from <447@ssc.UUCP> by tad@ssc.UUCP (Tad Cook):
+---------------
| In article <9010231900.AA29198@ucsd.edu>, BRUCEH@UTKVX3.BITNET writes:
| > I just got some info. in the mail about a new publication for
| > Ham Radio. It is called Communications Quarterly. From reading the
|
| It is supposed to be a technical quarterly to help take the place of
| the vanished HAM RADIO magazine.
|
| No one has seen a copy yet, but my reaction is that it sure is
| EXPEN$IVE. Costs as much as a monthly magazine, but it only comes
| out quarterly.
+---------------

You expected differently? If there were advertizers out there for techie magazines, HAM RADIO Magazine would still be around, instead of being a nod in the general direction of technical hams by CQ.

I'd like to see an issue myself. If it turns out to be a good technical magazine, I'd be willing to shell out for it; <insert favorite deity, if any> knows the companies which cater to appliance ops won't.

2457. Re: No code license & CW Bashing

Newsgroup: rec.ham-radio
Date: 1990-10-28 18:05:07 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Oct28.180507.10292@NCoast.ORG>
Source record: 7319

As quoted from <1990Oct24.170127.2103@dcdwest.uucp> by plb@dcdwest.uucp (Phil Blais):
+---------------
| I have very mixed feelings re the communicators license. From the
| traditional viewpoint "if had I to - so shud you" attitude I'm against
| the no code license. IMHO the no code advocates are sterotypical of the 'me'
| generation i.e. want it all but aren't willing to work for it.
+---------------

Tradition holds no weight with me. The laziness argument holds no weight with me because it is a negative argument with no corresponding positive argument.

I request *again* reasons why CW *should* be required of *all* hams. Reasons which do not boil down to negative arguments but positive ones saying what specific benefit comes of requiring CW of all hams *and* *proving* *it* --- the few respondents providing positive reasons have so far stumbled because of either the proof or the requirement that it apply to *all* hams. Since in four months, three online services and the local club have yet to succeed, I don't expect anything this time, but I give you the chance anyway. *Convince* *me*, I will accept reasonable arguments if you can prove that they actually apply to the topic at hand and not a straw man (like a local club member likes to use) or something worthless to the survival of U.S. ham radio like tradition. (Traditions are great, but they won't stop the FCC from parceling out our bands to the highest bidder a' la 220MHz.)

Awaiting what will in all likelihood be much heat and no light,
++Brandon

"V" because it works well with the old mechanical bugs and even sideswipers.

> of the way the mechanical teleprinters operated.

Well,partly. It is the bit arrangement of Murray-Baudot code. Sending "RYRYRYRY" causes the transmitter to spend very nearly equal amounts of time on MARK and SPACE. This made it possible to measure "average" magnet current. Also, it made it easy to tune to, even by ear. Back then, before modern frequency tolerance requirements, it also made it easier for the sending station to set frequency, because a "slow" counter would read out the channel center frequency, which is what military and commercial users go by.

Granted, this was all pretty primitive, but Good Grief, Charlie Brown, this is late 30's and early 40's technology we're talking about here.

2460. Re: No code license & CW Bashing

Newsgroup: rec.ham-radio
Date: 1990-10-28 18:56:59 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Oct28.185659.11837@NCoast.ORG>
Source record: 7324

Here I go again, trying to reason with folks whose minds are made up and won't listen to (or will twist into their own shapes) anything that doesn't fit their prejudices. Was it Phil Karn who pulled out the straw-man demolisher posting last time? Maybe it's time for a repost.

As quoted from <9217@b11.ingr.com> by herbster@b11.ingr.com (Joe Herbster):
+---------------
| In article <1990Oct24.200305.9402@athena.mit.edu>, tmurphy@athena.mit.edu (Thomas C Murphy) writes:
| > In article <1990Oct24.170127.2103@dcdwest.uucp> plb@dcdwest.uucp (Phil Blais) writes:
| > >
| [trimmed.....]
| > >the no code license. IMHO the no code advocates are sterotypical of the 'me'
| > >generation i.e. want it all but aren't willing to work for it.
| hmmmmmmm......get out the asbestos suit......
| > Sometimes I think I'll scream if I see this type of comment one more
| > time.
| sounds like the whining "me" generation to me..........
+---------------

I am sick and tired of all the self-proclaimed Gods of Ham Radio who insist that because they like Morse Code, they have the right to force it on everyone else. Since when does the fact that you like it count for anyone except yourself?

And DON'T spout laziness at me. I learned the code at 5wpm, am polishing my 13wpm and looking toward higher speeds. I *use* CW. Yet I see no reason not to have a no-code license. (One straw man demolished.) And laziness, as spouted by all you pedagogues, sounds suspiciously like whining about YOUR work in learning Morse Code being supposedly declared worthless, BECAUSE YOU HAVE YET TO PROVIDE A GOOD REASON FOR ALL HAMS TO LEARN MORSE CODE.

(Note the *supposedly*. Another straw man demolished: we are not declaring CW an illegal or invalid mode, just stating that it is not the Exalted All-Highest GOD MODE.)

More straw men below: lots of folks beat you to it, but none of them passed *all* the tests, then or now.

+---------------
| 1) EFFICIENT. CW is conservative of band spectrum. CW is "THE" QRP
| mode. CW is "fault-tolerant" as a digital mode. The good
| old gray-matter processor still beats the best CPU algorithm
| ever written for pulling meaning out of the mud.
+---------------

Fine, so CW is a good mode for getting through. It is efficient ONLY in terms of bandwidth, however; it absolutely flunks the test of efficiency in practical terms, e.g. information flow vs. time. And its inefficiency in that respect is the main reason it can get through when other modes can't.

Moreover, this doesn't demonstrate a requirement for all hams to know or use it. If the bandwidth argument were *that* important, land mobile would be using CW. And some of us aren't able to work QRP (in my case, I have no way of getting a hundred milliwatts to go anywhere except into the walls of the courtyard surrounding my apartment; I get d*mned little signal out of here with 100 watts into the antenna!). And in any case, QRP is not a fundamental purpose of amateur radio.

```
+---------------
| 2) SIMPLICITY. CW is the simplest form of communications to build a
| transmitter or receiver for. New hams can be encouraged to
+---------------
```

Transmitter, yes. Receiver, no. Or have you, presumably more experienced with older equipment than I, forgotten that one can build an AM reciever using a single crystal and very little else? Or even a nail?

```
+---------------
| excessive cost. In the event of an EXTREME emergency, this
| is the easiest mode to "Improvise-and-communicate" with.
| CW requires no modulation, modems, software, .....
+---------------
```

In the event of an EXTREME emergency, if I have anything around to improvise FROM, it's probably a 2m or 220MHz HT which is in working order. If I don't have that around, chances are bI have nothing else from which I can devise *anything* except aformentioned AM receiver.

```
+---------------
| 3) FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace
| allowing one to think of something interesting to say while
| sending. CW even has a parallel to the smiley .... ..
+---------------
```

Good. Now why does this apply to ALL HAMS ALL HAMS ALL HAMS ALL HAMS ???????? The favorite straw-man tactic: tell us why it's good in and of itself, not why it's so good that all hams ABSOLUTELY MUST WITH NO EXCEPTIONS learn it.

```
+---------------
| CW may be used by the speech impaired, sight impaired, and
| the hearing impaired equally without extensive adaptation.
| It is difficult to scream, rant, or rave in CW.
+---------------
```

This I will grant. It still doesn't make it exalted to the point where all hams MUST BY LAW WITHOUT EXCEPTION demonstrate proficiency in it.

```
+---------------
| 4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse
```

| and his code have been historically significant to the
| evolution of Amateur radio. It is also the only digital
| mode easily recognized by non-amateurs in movies etc. CW has
+---------------

So show me the line in Part 97 that states that amateur radio exists to provide a showcase for historical radio equipment and procedures. What *I* see in Part 97 is:

"SECTION 97.1 BASIS AND PURPOSE

" The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:

"(a) Recognition and enhancement of the amateur service to the public as a voluntary noncommercial communications service, particularly with respect to providing emergency communications.

"(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.

"(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communication and technical phases of the art.

"(d) Expansion of the existing reservoir within the radio service of trained operators, technicians, and electronics experts.

"(e) Continuation and extension of the amateur's unique ability to enhance international goodwill."

Please note that CW is not mentioned even once, nor is preservation of antiquated radio techniques. Moreover, CW does nothing at all for (b) and (d) and does little for (a) (both voice and, increasingly, packet have supplanted it because they are more efficient IN TERMS OF INFORMATION PER TIME and because they are conducive to third-party emergency communications).

(c) is irrelevant, because it is an inverse relationship, i.e. it says nothing about how any form of communication enhances the amateur radio service but instead how the amateur radio service can enhance any form of communication.

What's left is (e). Which is the straw man EVERY ANTI-COMMUNICATOR ends up with, because it's the only one that has anything remotely resembling a good argument for it, along the lines of it's *already* used that way. (Yes, I know, you say you aren't anti-Communicator. Nevertheless, this is the most popular argument.)

Another straw man trashed: what's used that way is not CW, but prosigns and Q signals. Both of which are used on packet, and Q signals can be used on voice --- and simple single words are used for the prosigns. To express anything not covered by prosigns or Q signals in voice, packet, OR CW, you still need a language in common.

```
+---------------
| its roots in pre-telephone telegraph communications. How can
| children play "cowboys-&-Indians" without a rail-road telegraph
| operator??
+---------------
```

I know the argument by tradition / history is common, but an argument by *sentimentality*???! Oh, come on. This one doesn't even deserve refutation. Relevance index: zero.

```
+---------------
| 5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the
| operator with a sense of accomplishment and satisfaction.
+---------------
```

Communicating via QRP SSB is a SKILL and thus rewards the operator with a sense of accomplishment and satisfaction.

Communicating via auroral propagation --- any mode --- is a SKILL and thus rewards the operator with a sense of accomplishment and satisfaction.

And please demonstrate that this applies to all hams, and that this is the ONLY way to gain a sense of accomplishment and satisfaction.

So: five straw men proposed, five demolished. Next?

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 27 to November 06, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 21 October and 27 October has been mostly Low. Moderate activity did occur early in the period due to several impressive energetic events suspected from Region 6311, which was (at that time) less than a day beyond the western limb. The most impressive was the M8.5/1N major flare of 20 October that was discussed in detail last week. On 23 October, evidence of a potential proton flare was observed when Type II and Type IV radio sweeps were observed accompanied with a slight proton enhancement at satellite altitudes. The Type II and IV sweeps were observed at 08:09 UT on 23 October. The proton enhancement began near 09:00 UT on 23 October. Analysis of the Type II and Type IV radio sweeps resulted in an estimated interplanetary shockwave speed of near 1,600 kilometers per second.

All of this activity was uncorrelated with any optical phenomenon on the visible solar disk. Considering that a region just beyond the west limb spawned the major flare of 20 October, it is reasonable to conclude that the source for the Type II and IV sweeps (as well as the proton enhancement) were likewise produced by a region beyond the west limb. This sets up the interesting possibility of potentially strong solar activity occurring with the return of these active regions in less than two weeks.

Solar activity since 23 October has been low with only minor C-class flaring and subflaring. Several solar filaments also disappeared this week but had almost negligable impacts. The sunspot number for 28 October was 139. The running sunspot number for 28 October is 150. The 90-day average solar flux value is 194.

Geomagnetic activity was low early in the period, but reached minor storm levels on 24 October due to an equatorial coronal hole. Conditions at middle latitudes were mostly Active with at least one minor storm-level magnetic excursion occurring between 12:00 UT and 15:00 UT on 24 October. High latitudes experienced periods of minor to major storming. Activity may have been enhanced somewhat from the large filament which disappeared near 20 October.

Auroral activity reached moderate levels at middle latitudes, while high latitudes experienced predominantly moderate activity with bursts of high

auroral activity. Low latitudes unfortunately, were unable to spot any auroral activity.

Radio propagation conditions were good throughout most of the period and over most paths. The only exception was 24 October when degraded conditions were noticed over high and middle latitudes. Periods of poor propagation occurred during the local evening hours due to auroral-induced signal flutter at middle latitudes. The geomagnetic and auroral activity was expected to last longer than it did, but conditions recovered rather quickly on 25 October to near normal.

Solar activity is expected to remain mostly low throughout the next 7 to 10 days (28 October to 06 November). The solar flux appears to have bottomed out for this solar rotation with a minimum of 154 occurring on 26 October. Flux values should begin to rise now with the gradual return of the active solar hemisphere.

We are currently facing the inactive hemisphere of the sun. The sun has maintained a trend of one active and one inactive hemisphere for many months now and is expected to continue this trend into 1991. There is a fairly well positioned coronal hole near the solar meridian (on 27 October) that should have a slight to modest impact with the earth between 29 and 30 October.

Geomagnetic activity is expected to remain mostly quiet to unsettled throughout the next 10 days. The exceptions will be 29 October through near 31 October. At that time, geomagnetic activity is expected to be enhanced somewhat due to the coronal hole discussed above. Conditions may reach active levels at middle latitudes with K indices of 3, peaking possibly at 4. A-Index values for middle latitudes on these dates should range from 10 to near 16. Activity is expected to peak on 30 October over middle latitudes. High latitudes may experience brief periods of minor storming with potential peak K indices near 5 and associated A-indices ranging from 15 to 26. High latitudes will experience most of the activity associated with the coronal impact. Activity over high latitudes should peak on 29 or 30 October. Geomagnetic activity should subside again to mostly unsettled levels for the remainder of the week.

Auroral activity is also expected to become enhanced between near 29 October and 30 October. Activity will remained confined to the high latitude regions where mostly moderate activity should be observed with potential brief bursts of high activity. Middle latitude regions will be able to spot mostly low activity. Low latitudes will likely be unable to spot any auroral activity. Activity is not expected to be very intense.

Lunar phase will interfere with attempts to spot auroral activity this week. Taking lunar phase into consideration, auroral activity will not be visible from low latitudes. Activity at middle latitudes will appear to be of low intensity and may not be visible at all due to the brightness of the northern horizon caused by the moon. High latitudes, however, should easily be able to spot auroral activity despite the brightness of the moon. Activity at high latitudes, however, may appear lower than it actually is, due to the lunar interference.

Radio propagation conditions will remain good throughout the week, except for the period of expected increased geomagnetic and auroral activity between near 29 October and 30 November. Propagation will become noticably degraded at high latitudes as auroral activity produces moderate to strong signal flutter over many HF frequencies. Middle latitudes will notice a slight decrease in propagation quality and signal behavior but should, for the most part, retain good to fair propagation. Low latitudes should remain unscathed by this activity, maintaining mostly good to very good propagation conditions throughout the week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 27 OCTOBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6326	S26W71	040	0030	HRX	01	001	ALPHA

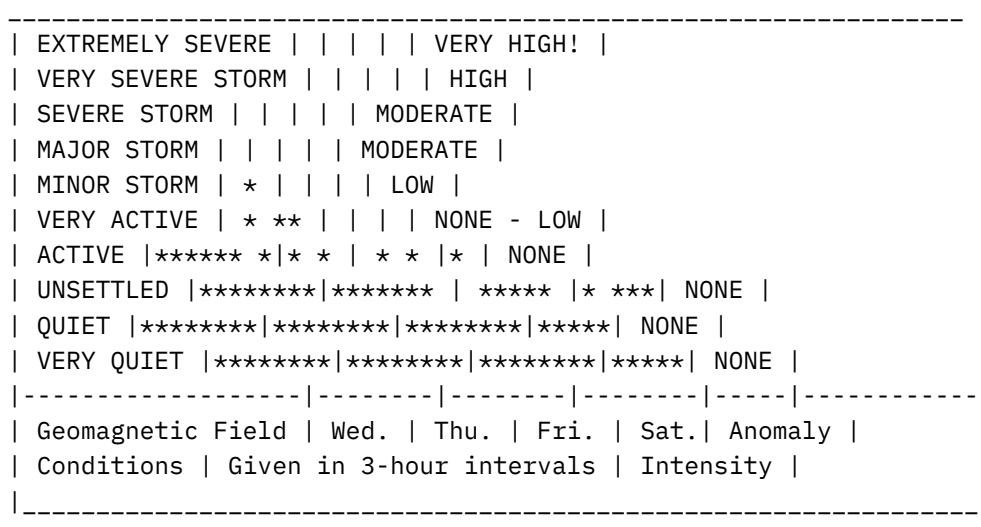
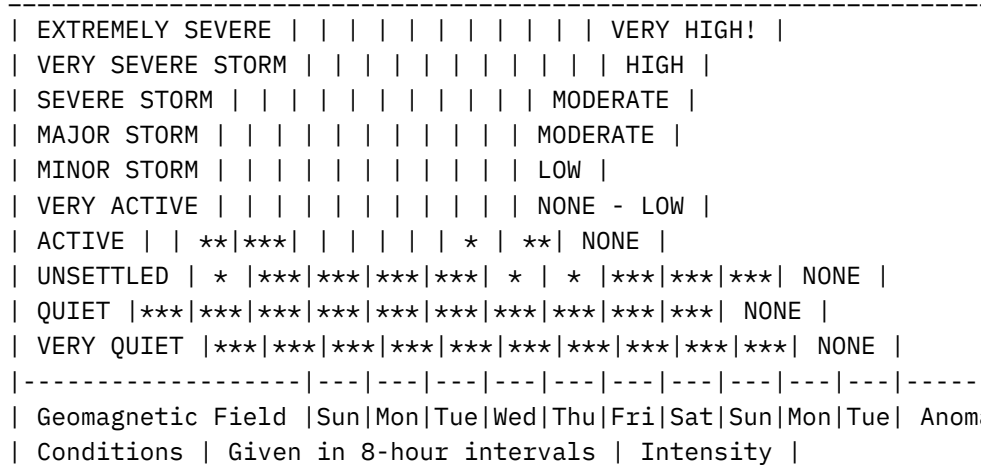
GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (28 OCTOBER - 06 NOVEMBER)



```
|_____________________________________________________________________|

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena.
Transient energetic solar events cannot be predicted reliably over periods in
excess of several days. Hence, there may be some deviations from the
predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

Cumulative 60 day Solar Activity Record
Start Date: August 29, 1990

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained
from Ottawa. The right-hand column describes the relative solar activity for
that period based on the average number of major and minor flares that can be
expected for related solar flux values. Plot lines labeled with the letter "F"
represent days where at least one major flare occurred (ie. class M5 or greater
flare).

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

> How about "s/he"?

Try saying it over voice. (Oh, oh, another argument in favor of CW --- except that it's obviously workable on packet, too. Oh, well, maybe they'll just ignore that annoying little fact liek they do so many others.) And even in CW/RTTY/packet, it's a pain.

I used to use "s/he"; now I just use "they". Easier and less messy. And less annoying to read.

>5) REWARDING. Communicating via CW is a "SKILL" [...]

Herbi,

Points 3, 4 and 5 are personal opinions. Points 1 and 2 are provably false assertions. See my Reply Comments on PR Docket 90-55 for the details; I posted it here back in early September.

None of your points constitute valid arguments against a codeless license, although you are perfectly free to promote voluntary proficiency in or use of CW by anyone who will listen.

Phil

2464. Computer interference & cars New Problems

Newsgroup: rec.ham-radio
Date: 1990-10-28 19:16:00 UTC
From: AGENGCC@OSUCC.BITNET
Message-ID: <9010281920.AA28323@ucsd.edu>
Source record: 7320

Most of the problems I see posted regarding RF <-> automotive problems look to me like the computer getting into the radio or the other way around. As we put more and more computers in cars the interference problems are going to increase.

In reading through some of the literature an automotive and agricultural networks I find that Chrysler has standardized on a single wire network connection among the various embedded computer that will be scattered around cars of 90's. This would be a wire of some length say, 2 meters terminated by computer gates of about 100 ohms impedance if I my recall is correct this is called a Beverage antenna. To keep interference down in either direction will be interesting.

Some of the automotive networks operate at 1 megabaud. With the forecast death of CW maybe we could use these soon to be abandoned bands as inter automotive comunication.

> What? One minute solid copy or answering 7 of 10 multiple guess questions
> on received text is a test of on-the-air procedures? I hope not!

I agree with you there. In fact, I would like to ask whether
any VEs are giving the code exam with multiple-choice questions. It
seems to me that such a method would partially defeat the purpose of
the test. The fill-in-the-blank questions that I had to answer when
taking tests from the FCC examiners are a better check of accurate
copy.

> CW is a MODULATION method not a LANGUAGE! Whatever language you

That is true. Prospective hams are given a Morse code test, not
a CW test. Many ignore the distinction.

> Deep Space Network other techniques are used. CW is as valid a modulation
> method as AM or FM and deserves as much attention on the exam as AM or FM
> modulation receives.

You can even send Morse code on AM or FM! ;-)

Sorry, I do not accept the eventuality of it. But I certainly do
acknowledge the POSSIBILITY of it, and that this possibility can be
a certainty if we take not action and let it.

> 1. Almost everything of much general interest will be encrypted
>securely enough so that only stupid key management will render it vulnerable.

This is likely to be the case and is what SHOULD happen.

> 2. What isn't encrypted will be massively illegal to listen to
>and people will really be going to jail and having their equipment
>confiscated for trying. Simply enforcing a broad construction of the
>the present ECPA as it stands would go pretty far in this direction.

This could happen, but strong lobbying, with encryption technology as the
evidence can prevent this. If it can be held out until #1 is well under
way to full implementation, then #2 won't really become a worry anymore.

> 3. Scanners and other general converage radios will become
>contraband, illegal to possess regardless of what they are actually
>tuned to. This is the only way that enforcing an anti-listening
>("privacy") law could possibly be practical, as the actual act of
>listening is so passive, private, and undetectable.

While the USSR becomes freer, the USA becomes more restrictive. This
is also not an eventuality unless we let it be (and we seem to be).

Such a ban would have severe consequences. Ham radio operators would
not be able to check for harmonics in their signals, and ham radio itself
could have its very existance threatened.

> 4. The public will be assured that now everything is illegal

>result both criminals, and the shadier side of law enforcement will
>be happily able to monitor private individuals for very questionable
>purposes well into the forseeable future.

This won't happen unless government causes encryption to be compromised
in some ways. It has been suggested by some that DES is so compromised
by the NSA. Even if that is true, they still need a significant (though
apparently they have it) computational power to break it. They cannot
listen to ALL communications.

Computing power continues to increase. What was once mainframe power is now in your hand. Imagine what a collections of 65,536 processors of 1999 technology will be able to do. It will be necessary for cryptology to keep up with this (theoretically it can) and for that to be available to everyone for their appropriate communications (paranoid governments won't allow it).

Presently cryptographic technology has more restrictions that general coverage receivers. Think about it.

When I took my code test two months ago (and STILL no certificate!), the VEs DID use a multiple choice test for those who failed to copy one solid minute. In fact, the pre-test instructions included hints like: "listen for key phrases such as "My name is..." We were then supposed to listen very hard for the next letter. If the next letter was, say, M and the multiple choices for the senders name were Martha, Jim, Sam, and Tracy.... well, you can see how it goes....

I learned the code and enjoyed it but doubt I'll use it in practice. I think the point here is that if your VEs are no-coders, you can fulfill the letter of the law with very little effort.

I must not be the only person getting tired of all the postings about cw, so let me add one more :-)

Lessee. If you want a license to transmit on the HF bands, you will find that there are two major and about equally popular ways in which such transmissions are made. One is by voice (which took us all several years to learn when we were small) and the other is by cw (which can be learnt at the basic level in a much shorter time). Nobody is so set in their ways that they know for sure that they are never going to use one or other of these modes. That is why everyone who wants an HF transmitting license should have some basic familiarity with both modes. Thus, there are questions on the exams about international phonetics - whether or not you think you will ever use voice. There is also a test of very slow speed morse code, whether or not you think you will ever use cw. Once you have demonstrated the basic skills you can get on the amateur bands and use either or both of these modes. If you want to make contacts with overseas stations, you will find that about half of them are using one of these modes and half are using the other (at any one time). Knowing the basics of the morse code, you are in a good position to start communicating with others using this mode, just as knowing the international phonetics helps when you first go on the air using voice.

OK. If you want to go on VHF, where people generally work with much stronger signals and the majority use voice to communicate (it is undeniably faster when signals are strong), there is no particular reason to learn the mode that is less common, and that is why we will probably have a VHF license that does not require one to demonstrate ability to decode even the slowest speed morse code.

If you know for sure that you are want to get on the HF bands and only ever talk with people across town who are nice and loud, then you might just as well use the telephone - it's more private and it's free.

Of course cw is not for everyone. Nor is voice. Nor is being able to calculate time constants of various combinations of resistors and capacitors nor many of the other things we are tested on in order to have a transmitting license.

If, once you are on the air, you decide you don't want to use morse code, then don't use it. If you decide that voice operation takes up too much frequency and the consequent crowding of the band is not to your liking, don't use voice.

Does any of this make sense?

This is appropriate for private communications.

For government, public agency etc communications, maybe not.

We have the Freedom of Information Act, lots of restrictions on
what can be discussed at "closed door" meetings of city councils,
and declassification of things that don't really have to be secret.

If government communications is done on a "need to encrypt" basis,
there should still be a lot of interesting stuff out there.

On the ham bands of course, we have only a limited opportunity for
legal encrypted communication.

>listen very hard for the next letter. If the next letter was, say, M
>and the multiple choices for the senders name were Martha, Jim, Sam, and
>Tracy.... well, you can see how it goes....

That is sure different from the test I took last summer. The instructions were emphatic that your fill-in-the-blank answer had to be exactly as sent, or be marked wrong. As an example, if the senders QTH was sent as "paramus, nj" and you wrote "paramus, new jersey", or "paramus, n.j." it would be marked wrong.

In addition, the test leaned towards questions that you couldn't answer from context if you had missed a key character, like "how high was the sender's tower?" (something like 179 feet) or some third parties call sign that was mentioned.

Multiple choice sounds like a piece of cake in comparison. Just out of curiosity, which VEC was it? What other big differences in procedure are there between VEC's besides the code test?

Jon Bloom asks:

> Glenn, is that the only MAR-x that's "just like" an Avantek part? If not,
> is there such a thing as a MSA-to-MAR cross reference?

Well, the catalogs which are handy seem woefully out of date but...

A very cursory look makes me think that MAR-1 thru MAR-8 are
MiniCircuits numbers for MSA-01 thru MSA-08 all with the Avantek
85 package which MiniCircuits calls a VV-105 package.

I really *must* get some newer catalogs though...

I think you'll find that ARRL is a lot goosier about losing their tax status
and is probably playing it safe. Let's face it, if they had to start paying
income taxes on the publishing empire, they'd be in real deep trouble.

>
>I am especially puzzled with the concept of "open" and "closed"
>repeaters and how the latter fits in the picture of amateur radio. Can
>someone please clarify this terminology for me?

There are two types of amateur repeaters in use in the USA.

1. Open. An open system welcomes all users. It may use technical
access controls, but the access information is widely
and freely available to everyone. New users are actively
welcomed to the system.

2. Closed. A closed system welcomes only a specific group of users.
It may use technical access controls and attempt to
keep access information restricted to the group. Or
it may not use technical access controls, relying instead
on group pressure to discourage non-members from using
the system.

>As far as I understand it, there are a multitude of "private"
>repeaters. What's the point in having a dozen repeaters in a
>questionable QTH (and limited range) in comparison to ONE good
>repeater in a high (broadcast) tower or similar? Or ARE they actually
>all that good?

Most repeaters of both types are located on good sites. Some of the very
best repeaters, in a technical sense, are closed machines while some of
the very worst are nominally open. There are machines of excellent quality
of both types in this area. Access to excellent sites is often as easy
for an individual as it is for a club. Very few repeaters operate from
the home of an individual. Many excellent sites are available to amateurs
either free or for a nominal rental. There are two amateur systems operating
from the broadcast tower where I work. They are both supplied free sites
as a courtesy to the amateurs.

>What would you say is an average working range of a typical repeater
>in Ohio, or any other place with flat terrain?

Average working distance varies wildly depending upon siting, technical
sophistication, terrain, and co-channel interference. In the rough
terrain of North Georgia, the working range of a given machine may
vary between 15 and 120 miles depending on the direction of the user
from the machine. In flat terrain the working distance varies between

50 and 120 miles, depending mainly on site height and co-channel interference.

>In here, ALL repeaters are club-owned and completely unrestricted for
>any user. There are currently seven (7) allocated repeater channels on
>2 meters (145.600 - 145.775, 25 MHz raster) and they seem to be
>enough.
>
>Am I missing something here?

Many machines here are club owned. Club owned machines may be either closed or open. Many other machines are owned and supported strictly by an individual. These individually owned machines may be either open or closed. In the US we have many more repeater frequencies than you do. Most of the popular channels are full in the Metro areas. Most of them are vacant in rural areas. Our bandplans are different depending on the part of the country you are in. Some use an upright 20khz spacing, others use upright 30khz spacing, and in the most populated areas, a upright/inverted 15khz system is used. On two meters, repeaters are allowed between 144.5-145.5, 146.0-147.0, and 147.0-148.0. In general the 600khz split pair is contained in one subband, however, there are machines that straddle 147.0 in some areas. In addition there are odd machines that use a split other than 600khz in some areas. I guess you could say that a bigger country, bigger subbands, more mobile amateurs, and perhaps more troublesome amateurs leads to a completely different set of solutions than the solutions that work in your country. Not that our solutions always work, as postings on this group indicate!

Yes, it makes sense. But unfortunately we are dealing with an emotional issue, which of course removes any logic from the discussion. Most of the arguments against can be re-phased as 'I had to so everyone else will.' Another variation is 'It keeps out the rif-raf.', but of course 14.313 and 14.145 is somewhat hard to defend in this argument. Most arguments for are generally sound.
Personally, I don't see the problem with a VHF/UHF unlimited license without code. It won't make a bit of difference to my HF operation, I doubt it will affect my DXcluster operation, but it might make getting into the BBS a little more difficult. On the positive side maybe I will find someone to talk to on VHF SSB that does not require a huge weak signal antenna. Another positive point is that I might find a reason to invest int TCP/IP.

2483. RSGB financial traumas..

Newsgroup: rec.ham-radio
Date: 1990-10-29 17:52:20 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <29.Oct.90.17
Source record: 7210

There have been many recent discussions here in the UK about the financial
status of the RSGB. The current RSGB management has shown its ineptitude
by failing to submit accounts for two of its trading subsidiaries (which have
as a result been removed from the register of companies).
The Annual General Meeting of the RSGB takes place next month; the RSGB
council are likely to face hostile questioning from those attending; the
hall for the meeting is limited to some 200 attendees however.
(Cynics may say that, since the RSGB council will have a large number of
proxy-votes at their disposal, the limit of 200 attendees will make it possible
for council to proxy-vote through any unpopular decisions...)
At previous AGMs, there have been prohibitions on the use of portable tape
recorders to record proceedings; the 'official' RSGB transcripts of
the meetings have shown a number of what can at best be called 'creative
inaccuracies', and at worst, 'Lies'.
The really worrying thing is that the RSGB are the license-holders for all
UK repeaters. If RSGB as a body ceases to exist as a result of financial
pressures, I wonder who will take over the license-holding on repeaters?
I will be going to the AGM as an 'interested observer'; i wonder if maybe
I should hand out ARRL membership-forms as a way to show my disapproval
of the present style of RSGB 'Management' ??
More news next month...

What does IMHO mean? Is this an "in-group" acronym - or am I ignorant of some well known English abbreviation?

2491. Here are QSL routes for CQ WW

Newsgroup: rec.ham-radio
Date: 1990-10-29 20:19:19 UTC
From: lewine@dg-rtp.dg.com
Message-ID: <1090@dg.dg.com>
Source record: 7183

Here are some QSL routes for some stations on
from this weekend's CQ WW DX contest.

6I2A via XE2AQ
YM??? via HA0NNN [Sorry, I did not write down the full call
on the slip of paper I brought in to work.]
ZF2JI via KG6AR
XW1L via W3HUP
IQ4A via I4VEQ
FJ9A via FJ5AB

If others could post QSL routes that they copied, it would reduce the
number of requests on the net. If I don't see the ones I need in the
next few weeks, I will post a request.

P.S. Don't you hate it when DX'ers refuse to give out QSL routes on
the air and just call QRZ?

I could suggest using the sound input on the new Macs or an equivalent
(Mac recorder from Farallon) for the older macs, Then digitally process
the signal to get the code out of it and then decode the morse.

Personnally I would demodulate the audio externally and feed the resulting digital signal
to one of the handshake lines of the serial port and do only the morse decoding in the mac.

I know nothing on algorithms for morse decoding but would like to have a
look at that.

I have an ICOM 745, _and_ the service manual. Curiously, the service manual says nothing about replacing the battery backup; in fact, it doesn't even give more than a black-box description of the memory module. I have a replacement battery, but haven't yet figured out get the new battery in w/o losing everything. Supposedly one uses a DC power supply to hold things while unsoldering/soldering the battery, but no clues in the manual.

Any netters out there who know any more?

Were conditions fantastic, or what? People are going to be talking about last weekend for a very long time. The last two sunspot peaks weren't anything like this one. Surely the last comparable one was 1957, but that was before even a lot of us old farts had our licenses.

There must be some new record scores. Has anyone heard any? (Like P40V?)

2495. Computer interface for SuperMorse CW decoding

Newsgroup: rec.ham-radio
Date: 1990-10-29 22:05:46 UTC
From: eaiu063@orion.oac.uci.edu
Message-ID: <272CA7BB.12879@orion.oac.uci.edu>
Source record: 7216

- --------
I have been trying unsuccessfully to build an interface to
my PS/2 so SuperMorse can decode the CW off my radio. I
first tried a tone decoder circut, with little luck. Then,
following some advise I read on this net, tried using an
op-amp. This too was unsuccessful. Perhaps I am a little
less technical than I need to be. So, if someone has accomplished
this or knows how to convert the presence of a tone to
the closing of input pins on an RS232 port, I would be
forever indebted! Please reply to the net, as mail will
not be reaching me soon. Thanks again!!
Byon Garrabrant

>"You can't leap a chasm in two jumps."

Have we QSO'd, Brian? I frequently am on the Novice sub-bands, ready to
welcome all the newcomer bI hear. I get a thrill out of being the "first"
or "second", etc QSO for the new Ham, and I hope that I'mnot causing any
undue stress by "pushing" just a little faster than he/she's sending.
I take my 100 (or less) watts and straight key down to whatever speed
is necessary if I hear a QRS.

Occasionally, I will get one of the hot-rods who sends at 10 or 12 WPM, even
though he/she can't copy near that fast. By the time I find out what the
situation is, there's too much QRM for he/she/(it?) to copy.

Not too long ago, I talked briefly with someone at about 3WPM.

But I agree that not enough of us will do this. Sometimes it seems as if
the Novice portion is full of 20WPM.

Are you sure we haven't QSO'd? I'm gonna check my log when I get home.
Your call sure sounds familiar.

73, Dube Todd N5PDK

>written guarantee from that person that the unit is in perfect working
>order AND that if something does go wrong with the unit, that I will be
>able to send it back to the person and get a full refund.

If the 470 is that good a radio, it will keep its value. The only reason
someone would be letting go at that price is if the radio is broken, or
just totally ruined (e.g. scratched all to h*** and painted pink).

>Any suggestions or offers out there?

Get an IC-2AT use for the time being. You can get almost everything you
put into buying a used one back when you sell it (if you don't break it
or paint it pink). These radios seem to be fairly stable in value even
with use. Alternatively, the Yaesu FT-727 seems to be going for quite a
low price. The battery packs are NOT compatible between 727 and 470.

>Thanks for any help you can offer.

That's the best I can do, short of suggesting that you rob a bank, and if
I did that I'd probably get flamed that it was a violation of some rule
somewhere :-)

Name a time and place Brian, I'll be there. Ca to Tex 40M around 0400Z looks good.

I don't run power, I don't do windows and on 40M I run a random wire 85 feet long up 8' max. Thats why I run CW. On SSB I can't get arrested, but on CW I can work anybody I can hear until my fingers fall off. I use a keyer and Bencher paddles and am used to giving novice tests at 5 WPM. I used a computer to generate code speeds from 5 to 35 WPM and learned how to match my own speed and spacing with lots of practice. If you like it perfect, I'll use the computer and keyboard but that's bad for learning as it's too perfect. It's also sterile and un-human. CU QSY 7.125.

Quit living in the past, Jay. I think the statement was clear
enough in being limited to a select few hams.

> The second part of that is something I don't condone, but I again suspect
> you're tarring many, many volunteers with the brush of your bad, but local,
> experiences.

I don't think my area is _that_ unique. If some people are
using illegal radios in Rochester, NY, then some other people are
using illegal radios in Houston, TX and a lot of other places.
I am not "tarring" volunteers in general, just the ones with the
Ic02ATs and such. Don't change the subject.

> > On this we agree. As a group, ham operators are more sensible
> >than that. But there are those who behave exactly as described above.

> >they try to persuade the more sensible that they can justify it.
>
> So, instead, you establish a reputation for yourself as the
> famous flaming FidoNet newbie? Seems a bit counterproductive.

I didn't attach that appellation to myself - you did. And
nobody else that I know about has picked it up. If a little of what
you call "flaming" gets some discussion, and more importantly, some
THINKING going on in hamdom, then I don't regret it.

> Then why do you toast people in other areas based on your
> (admittedly bad) local experiences??

See above. Statistically, it would be naive to think that I am
the only one who has seen this type of behavior.

2506. ICOM IC-24AT extended frequency coverage

Newsgroup: rec.ham-radio
Date: 1990-10-30 01:07:10 UTC
From: endelman@wellworld.Sun.COM
Message-ID: <1807@exodus.Eng.Sun.COM>
Source record: 7201

Here's a collection of reposts for all those who want to know how to program their IC-24AT to extend its frequency range, and its performance outside of the normal bands. Thanks to all concerned for their contributions.

```
*****************************************************************************
*****************************************************************************
* ICOM IC24AT keyboard command summary *
* Copyright (c) 1990 *
* KC1IY and NM1D *
* Revision 1.1 *
* Distribution allowed if this notice is included in its entirety *
*****************************************************************************
*****************************************************************************
```

This is an attempt to document all of the known key sequences for the ICOM IC24AT (144/440MHz dual band hand held). Some key sequences may be common with the IC[2,3,4]SAT, therefore a few key sequences for those radios are also on this list. Some key sequences require options (such as the PL encode/decode board).

This is not designed to replace the owners manual, but to summarize the information in one place.

Note: Many controls vary depending on the current mode, i.e.: Scan up/down will search frequencies when in VFO mode, and will scan memory channels when in Memory mode. Consult the owners guide for complete information.

```
KEY/COMBINATION = Result, action
---------------- ---------------------------------------------------------------
0-9,A,B,C,D,#,* = note: when transmitting these will generate DTMF tones
0-9 = Enter frequency (can also use the VFO knob)
A = VFO mode / clear incomplete entry
B = Memory mode
C = VHF / UHF change
D = Call channel
* = Step frequency down/scan down
# = Step frequency up/scan up
MONI = Open squelch and change to input frequency (if not simplex)
while button is depressed
H/L/DTMF = Select High/Low power, or (while transmitting) send
preprogrammed DTMF codes

FUNC + 0 = Dial set
FUNC + 1 = PL enable (when option is installed)
FUNC + 2 = Code squelch [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 3 = Skip memory
```

FUNC + 4 = Duplex operation
FUNC + 5 = Code [NOT for the IC24AT, IC[2,3,4]SAT option only]
FUNC + 6 = Mask frequency
FUNC + 7 = Priority mode on/off (operation dependent on current mode)
FUNC + 8 = Set mode (several different functions, press A to exit)
FUNC + 9 = Real time clock and timer functions (press PTT to exit)
FUNC + A = Memory to VFO transfer
FUNC + B = Memory Write
FUNC + C = Split operation (cross band full duplex)
FUNC + D = Lock mode / Cross Band Repeat disable
FUNC + * = Scan programmed limits (down)
FUNC + # = Scan programmed limits (up)
FUNC + 5 + D = Cross Band Repeat enable (split mode must be on!)
Diode D14 (right diode on CPU board) must be removed to
enable the use of this function)
FUNC + MONI = RX/TX light enable / disable
FUNC + H/L/DTMF = Select DTMF Autodialer memory
Func + VFO knob = Change frequency/memory channel
(according to dial set, see FUNC+0)
Func + LIGHT = Lock light on (don't time out)

H/L/DTMF + VFO knob = Change output power (4 power levels when using 13.8 vdc)

The following key combinations selects "power on modes". Start with the radio
OFF, then hold down the indicated keys, and continue to hold them while turning
the power ON. Some 'modes' override others.

LIGHT + * = PTT enable
LIGHT + 0 = PTT Disabled (inhibits the transmitter, good security method)
LIGHT + 1 = 1 MHz digit set (4 digit frequency entry)
LIGHT + 2 = 10 MHz digit set (5 digit frequency entry)
LIGHT + 3 = 100 MHz digit set (6 digit frequency entry)
LIGHT + 4 = Scan pause until signal disappears
LIGHT + 5 = Scan pause for 10 seconds
LIGHT + 7 = Power Save deactivated (use this for packet operation)
LIGHT + 8 = Power Save (minimum - 0.125 / 0.5 second)
LIGHT + 9 = Power Save (maximum - 0.125 / 2.0 seconds)
LIGHT + B + # = RX Extended Range enable
This requires that diode D13 is removed (left diode on
CPU board). Note that this diode has already been removed
by ICOM at the factory on many units. Be sure to hold
these keys down until the activity display stops and is
showing a receive frequency.

FUNC + A = Reset the CPU (this will clear all the memory channels).

Has anyone actually tried this, and did it work? What is your serial
number?

I bought my 24AT last weekend and it's great. I recommend replacing the
antenna with one from a 32AT - several S-units better on 2 meter receive.
It doesn't do crossband repeater as-is, but there may be mods for this.
It does do crossband full duplex. I'm used to Kenwood products, so the
labeling and key sequences seem a little convoluted, but I'm rapidly
adapting. As-is, XMT/RCV 140-150, 440-450, and RCV only 138-174. Almost
everything with the radio is programmable, separately if it is unique to
a band (duplex offset, band scan limits, freq step, etc.). A full-featured

micro dual-bander.

I received the following mods for 24AT out-of-band from a very reliable source (although they don't specify RX only or RX/TX), for 75-195 MHz, 200-490 MHz, and 740-960 MHz. Rumor has it (unconfirmed) that the unit even switches to AM in the air band!

1. Remove diode D8 [see figure below]

2. Attach diode D7 [I believe this is already equipped]

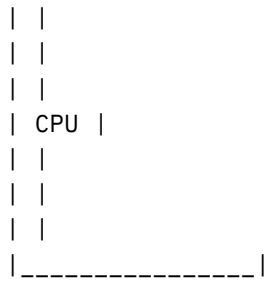
3. Attach diode D12

4. Remove diode D13

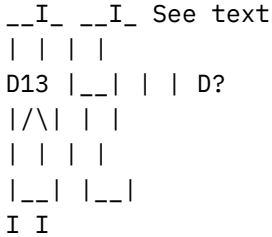
5. Simultaneously hold "LIGHT", "B", and "#" keys and turn the power on. Release all keys after the display goes out (checks all LCD segments). [This is supposed to enable the out-of-band frequencies above]

6. Simultaneously hold "LIGHT" and "2" keys and turn the power on. This enables the 10 MHz frequency digit entry.

7. Simultaneously hold "LIGHT" and "3" keys and turn the power on. This enables the 100 MHz frequency digit entry.



o o o D7 lower left pin is
[D7] [D8] anode of one diode,
o o o lower right is cathode
of the other. Top pin
o o is common
[D12]
o D12 upper pins are cath-
odes of diodes, lower
is common anode.



WARNING: I have NOT tried the hardware mods and cannot vouch for them, so proceed at your own risk!

I am told that the newer 24AT's (believed not to have made it to the US yet) will have the hardware mods in place, so only steps 5-7 will be necessary. So, try this first. Steps 5-7 don't seem to have any effect on a 24AT without the correct hardware mods. BTW, this has been attempted on 2 units with serial numbers around 1000 and mid-1100's, neither of which worked. :-(Like I said, the ones with the mods aren't here yet.

There are 5 screws to remove the case (5th is on the strap hook). Keep the top panel controls with the front of the radio, and be VERY careful pulling the back off because there are fine ribbon cables connecting the front & back. I don't think they'll take much flexing.

Additionally, diodes D7, D8, and D12 are surface mount components. They contain 2 diodes connected to 3 pins. Diodes D7 and D12 are different configurations. I believe D8 and D12 are different, so I wouldn't put the removed D8 in the spot for D12. Since they are surface mount, removal of D8 may not be all that difficult for those with steady hands and a fine low power soldering iron, but adding D12 would be a bear. I know of no reason that small discrete diodes couldn't be used in for D12. D13 is a small but standard axial diode, and can be easily cut.

It is for this reason I have not attempted the hardware mods. Now, if the referenced posting is correct, and only D13 needs to be cut... I'm guessing, but it could be that the rest of the diode changes are for the 10 MHz & 100 MHz digit entry (which I'd like but could live without) or out-of-band TX, or the like.

If anyone has tried only cutting D13 and resetting? Did it work? What is your serial number? Please post to the net!

If I learn more, I'll follow up.

> What is the TRANSMIT range when the mods are done to the IC-24AT?

Transmit range doesn't appear to be affected unfortunately. I was at
least hoping for 420-450 coverage. BTW, I tried each amateur band from
6m to 23cm. The PLL doesn't lock up at either end. Another negative
is the frequency step on 220 doesn't allow one to hit each possible
repeater slot.

All in all, not too bad. Now if I can get the cross-band repeater
function...

The mods posted for the IC-24 enable the wide receive only (as far as I
know). However, the good news is that there are more mods on the way
such as direct entry of MHz when out of band. BTW the out-of-band
sensitivity is very good (blew the doors off a BC-200xlt), except
near the ends of the range.

Per the posted information and current discussion on the modification of
the **new** ICOM 24AT dual band HT:

The Modification for freq. coverage extension:

1) Remove Diode D13

2) Keyboard [B,#,LIGHT] & Power-ON

Does work... FOR RECEIVE-ONLY!

The process is relatively simple; considering that most of the entire
radio is surface-mount parts... It turms out that Diode D13
is one of two "normal" sized diodes on the LOGIC BOARD easily
accessed and cut when the radio is opened...

(Two "standard" diodes are found below the logic IC1 by about
a 1/3inch, with IC1 at the top, looking at the diodes
D13 is the one on the left.)

Result: Recieve results (rough-info for about 6 hours of use after mod)

VHF: PLL begins to lock in at about 75mhz ...
and goes out of lock at about 280mhz
(display will go 0mkhz to 355mkhz)

UHF: PLL begins to lock in at about 355mhz
and goes out of lock at about 500 mhz...
PLL begins to lock in at about 795mhz
and goes out of lock at about 975 mhz...
(display will go 355mhz to 1310mhz)

Actual use/operation:

Aircraft: (108-136) seems to detect AM ok...
within 2 miles of Ohare Intl(ORD)
recieve of ground 121.--- moderate
receive of ATIS 134.--- good
recieve of tower and approach moderate
seems that high-end of band receives
better.
"looks like for a pilot who desires
to monitor ops at the port
prior to run-up or whatever
should work fine)

2m HAM: As shipped.
VHF HighBand (150-176): seems pretty hot-
unit is shipped rec'ing this stuff
220 mhz: VERY Dead receive at these freq.
hears only very-local transmitters
**ALSO above 200mhz step rate is
no smaller than 12.5khz
!!SO NOT ALL channels can be tuned
on freq- (UUCH!)
70cm (420-450): Fine
UHF (450-476): Hot reciever! - best ham mod'd receive
better than IC32AT mod rec...
470+ mhz works well-
chicago has allocations
of Public service and
business in 470-476
...and 24at works well

800mhz (convential/trunking):
Ah..it hears the band- perhaps
about the same as most
scanners- Not as hot as above
bands- BUT actual fairly
useable!
870-890 (cellular):
Yes, but channel step rate is 12.5khz
and cellular is on 30khz,
so can not be on exactly
every channel.
900mhz:
Did not check out much here...
did hear a few chicago
trunking systems at the
935 trunking band---
*also a lot of cellular images
present.

Bottom Line---
ICOM 24AT is a NEAT VHF/UHF/800mhz reciever and 2m/70cm
HAM radio in ONE.

The modification (D13 cut) provides a manner to receive
extended band coverage, without worrying about
accidental transmission in other services;
[however I would like to see 420-440 xmit at least
as I have repeater link/control in that
part of the HAM BAND; also 220 mhz freq&xmit
would be real neat; as well as 900mhz xmit
which a few repeaters do exist in the
area]

((((one only wonders what the next generation of HTs
will do???))))

I removed the D13 diode from my IC-24AT, serial number 1025, and it does enable extended receive ranges. Those below the aircraft band, however, do not actually receive the displayed frequency.

If the more extensive mod works better, someone please post results.

In-reply-to: john@qip.UUCP's message of 28 Aug 90 16:15:06 GMT

This is from the icom "translated fax".

Usable ranges after the mods will be:

RX: 114-130, 138-192, 403-485 & 825-903
TX: 138-168, & 410-485

In reality I have seen a great variance between different radios on where they actually lock up but I have been impressed at the capabilities of this radio

I assume you already have done the kbd mod for the out of band recieve so I will skip that part.

Order the diodes from Icom, part number 912-06015. They are about $2.50 each. A lot for a diode but not for a mod. These are tiny tiny surface mount dual diodes. They have three legs each and I forgot to see if they were common anode or cathode. Be safe and order the right ones from Icom.

Open up the radio. Clip out the glass diodes D13 and D14. D13 should already be out to enable the rx mod but D14 will enable cross band repeat. Func-C,5,D will activate the cross band repeat between two *simplex* channels.

Install the two diodes at position D7 and D12. The picture below may help find them.

I used the hottest and tiniest tipped iron I could find, tweezers and magnifying glass. Be extremely careful adding these diodes as I have seen how easy it is to lift an etch.

> Tracy.... well, you can see how it goes....

Sounds like an invalid test method to me. Doesn't make much
difference, I guess. People will find a way to do what they want
regardless...
BTW, this is not a shot at you personally. You went to the
effort to learn and, I will presume, took the test in good faith. If
the VE didn't bother trying to actually test the desired skill, I
guess that is more his problem than yours. Besides, if _you_ want to
use code as part of your amateur hobby, you will end up learning it
far better by actual use than by studying for a test. Have fun!

Plus TOR, FEC, Baudot RTTY, ARQ-Moore, packet, facsimile, SSTV
and others even more exotic.

> Knowing the basics of the morse code, you are in a good position to start
> communicating with others using this mode, just as knowing the international
> phonetics helps when you first go on the air using voice.

Forgetting for a moment our statutory obligations and treaty
terms, you are just as prepared to start communicating with hams all
over the world using any of the above modes with _no_ knowledge of
Morse code. So?
How about a test on the above "exotic" modes? One should at
least be able to interpret the acronyms and give a basic description
of the differences. But should it be a requirement for licensing?
Depends on what you think the purpose is of the exam, I guess.
I'm agreeing with you, by the way. May not exactly be easy to
tell...

> If you know for sure that you are want to get on the HF bands and only ever
> talk with people across town who are nice and loud, then you might just as well
> use the telephone - it's more private and it's free.

<chuckle> Good point.

> Of course cw is not for everyone. Nor is voice. Nor is being able to calculate
> time constants of various combinations of resistors and capacitors nor many of
> the other things we are tested on in order to have a transmitting license.

That is the beginning of the sensible approach.

> If, once you are on the air, you decide you don't want to use morse code, then
> don't use it. If you decide that voice operation takes up too much frequency
> and the consequent crowding of the band is not to your liking,
> don't use voice.

More sensibleness. Are you sure you want to say this here? ;-)

> Does any of this make sense?

Yup. Doesn't mean people are going to agree with it, though.
;-)

Fancy meeting you here. ;-)

The explanation that I remember also included the fact that
sending RYRY caused all of the mechanical parts that caused printing
to be moved, verifying that they all worked and weren't broken.

Hello to all info-hams readers.
This is a small selection of information
on the state of the Radio Society of Great Britain gleaned from packet
radio in the UK. The Society has undergone a massive reversal in its
affairs and begs the question "is the Radio Society of Great Britain about
to go bankrupt?" The Latest figure as of 30th June 1990 is that the loss is
126,000 pounds this equates to about 250,000 dollars. Whilst this amount
might seem small when view against the ARRL, it equates to about one third
of the total assets.

I would be intrested in the view of other amateurs outside of the UK, as I
feel that urgent advice is needed to stop the slide in the affairs of
the RSGB. All comments are welcome constructive or otherwise.

Mick G8VHB @ GB7WRG.gbr.eu ip 44.131.2.50 root@cms.scp.ac.uk

Path: GB7WRG!GB7DAD!GB7SUT!GB7TCM
Subject: RSGB Auditor's letter
From: G6JNS @ GB7TCM

I recently wrote to the new RSGB auditors voicing my concern about the
state of the accounting systems at HQ and the fact that the two
subsidiaries had been dissolved due to inaction by the Secretary. This
morning, 24th October 1990, I received the following reply. You may draw
your own conclusions.

Peter Goddard & Co
Chartered Accountants
London Road
Sunningdale
SL5 0JN

0990 872822
FAX 0990 872189

22nd October 1990 Our ref PBG/LAW

Dear Mr. Crosland,

Radio Society of Great Britain Ltd and subsidiaries

Thank you for your letter of 19th October. As you are probably aware my

firm was appointed accountants and auditors earlier this year and it became apparent very quickly that the Society's accountancy and administrativeaffairs were in a complete mess. When we took on the appointment as auditors we naturally did a company search ourselves and found that two subsidiaries had been struck off the live register at Companies House. As you rightly say there was an inter company loan between Lambda Investments and the RSGB and we therefore sought legal advice as to what should be done. It was decided that the only course of action open to the Society would be for Lambda to be re-instated. We have approval from the RSGB for this to be done and hopefully the company can be re-instated by the time the AGM is held. In any event we have confirmed that there should be no problem in having the company re-instated and therefore the 1990 accounts reflect this fact and also the fact that the inter company debt between Lambda and the RSGB has been waived and the investment written off. This tidies up the Society's affairs and puts them on a proper legal footing. The investment in the other subsidiary has also been written off as at 30th June 1990.

You mention in your letter that the accounting procedures of the RSGB have been in a chaotic state. This is quite correct and as a consequence, Counsel (sic) employed the services of one of my members of staff on a three days a week basis. He is trying everything he can to bring things into a proper order but I think it is fair to say that he has experienced difficulties, some of which relate to existing RSGB staff and other to the computer that was installed in the early part of the year, contrary to our advice. My member of staff, Philip Smith, will be at the Annual General Meeting and no doubt you will feel free to question him at that time.

I hope that I have clarified the position to your complete satisfaction, but if there is anything you are worried about, please do not hesitate to contact me. Although you may find me difficult to contact by telephone, you are free to try and if available I will be pleased to speak to you.

Yours faithfully,

(Signed)

P.B.Goddard

So now you know and can start believing what I have been saying for years. See you at the AGM on 8th December 1990 in Bristol and as the Chinese say "May you live in interesting times".

Subject: RSGB President replies !
From: G6JNS@GB7BBS._281.GBR.EU

To : NEWS@GBR
The following questions have been asked of all RSGB Council Members.

1. Do Council receive a monthly management accounts package on a timely basis ?

2. Does this package adequately explain to you the company's present financial position ?

3. Are variances from budget adequately explained and the consequences highlighted ?

4. Are trading and cash flow projections regularly prepared for a period of at least 12 months forward on a proper basis ?

5. Are the company's present and projected financial requirements, as shown by the management accounts, within agreed bank and loan facilities ?

6. Can the Society pay its suppliers within the contractual periods of credit without exceeding agreed banking facilities ?

7. Can you confirm that the company's bankers have indicated no intention to curtail its facilities ?

8. Do you regularly review the likelihood that any contingent or prospective liability of the company may become actual ?

9. Can you confirm that no such liability is likely to become actual within the next 12 months ?

10. If any contingent or prospective liability becomes actual, will the company have adequate finance to meet it ?

11. If the company continues to trade, can it avoid insolvent liquidation ?

12. Have you taken advice on the options available ?

13. Can the company trade without relying on receiving deposits from consumer customers ?

14. Do the company's existing banking facilities permit the payment on the due dates of amounts owing in respect of PAYE, National Insurance and VAT ?

15. Have all payments in respect of PAYE, National Insurance and VAT actually been made on the due date ?

have they not been paid on time and have any penalties been incurred as a result ?

The response from the President was as follows:-

"I acknowledge receipt of your letter dated 16th October 1990, and have no comment to make on the contents other than to say that it appears

that all the facts are not known to you."

So it would appear that the President is quite indifferent to the problems facing the Society and members views on the disastrous state of RSGB finances that will be partially revealed in the November Radcom. What the November Radcom will NOT tell members is how much the position has worsened since the 3oth June 1990. "Fiddling while Rome burns" is the phrase that springs to mind.

De G6JNS @ GB7BBS

2513. Need advice on 10-40m, no radial vertical

Newsgroup: rec.ham-radio
Date: 1990-10-30 12:38:10 UTC
From: eakin@rsmas.miami.edu
Message-ID: <10397.272d3bf2@rsmas.miami.edu>
Source record: 7165

I need some advice. It looks like I will be moving up to Wash. DC soon & will be in a 1st floor condo. This will force me to leave my tower, beams, etc. behind (boo, hiss). As you might have already guessed, the management has antenna restrictions. The good news is I can put up a relatively (?) unobtrusive antenna (i.e. vertical) while operating, as long as I drop it when I'm off the air. My father-in-law has been operating this arrangement with the Cushcraft R-4 (R-3?), 10-15-20 vertical. This is a nice arrangement as it requires no ground radials & I will have very little real estate (fenced patio w/ micro-lawn). However, I would like something that will also work 40m.

Since I will be operating from ground level, I can probably use something that can be ground mounted, although I may also be able to elevate it about 10' on a single piece of mast.

Ideally I am looking for a vertical that can:

1) operate 10-12-15-17-20-40m (don't care much about 30)
10-15-20-40 is the minimum.
2) requires no ground radials.
3) can be easily broken down to parts < 15' for storage in the back yard.
4) costs <$200.

Any ideas?

My fathers Volvo 480 suffers a fuel-injection 'hiccup' whenever i key
or de-key my 50-watt 2-meter radio. I have also set off auto alarms with
25 watts on 440MHz.
The local Volvo dealer was useless at helping with the problem of the
glitchy fuel injection; he has tried to get help from the factory in
Sweden, but there seems to be a chasm of misunderstanding between
'the real world' and 'the factory'.
Also i am told that some Toyota models have a nasty harmonic of the
digital clock xtal which hits 145.4MHz.

The preliminary total from PJ1B comes to not quite 60 million points.
They made something like 21,105 Qs in 189 zones and 804 countries.
The preliminary total for PJ9W comes to around 53 million points.
Not too shabby. Haven't heard the total from P40V yet.

I'm surprised that in all this no one else has brought up the sometimes-promoted genderless pronoun "na" (or else I missed it--sorry!). This has been advanced by some (feminist in particular?) writers as a gender-neutral but not sexless (like "it") pronoun to indicate a person without gender being a necessary part of the identification. I've read a novel or two which used "na" and it was admittedly hard to get used to, but it was at least clear that "na" meant a person and "it" meant a thing. Interesting.

Subject: Japan's "CQ Ham Radio" magazine (?)

About 10 or so years ago when I was working at one of the more
famous former amateur radio manufacturers in Benton Harbor, Michigan,
we used to get a really good magazine from Japan called "CQ Ham Radio".
This periodical was about an inch thick per month (!) and had lots of
great articles (in Japanese, of course). Although I could not read
the text, the schematics, part numbers, graphs and mechanical
drawings (thanks to the metric system) were always plenty to get the
gist of the articles and also to build the equipment described. The
magazine was mainly technically oriented (or at least most of the
articles on DX and other nonsense were unreadable, anyhow) and it
really seemed at that time to be pushing the state of the art. It
also always had the announcement of radios several months before
they were available in the US.

In any case, I'm trying to find out if this magazine is still
published and if it is available somehow through subscription.
My understanding back then was that it was available but cost
".... a couple hundred dollars [US] a year.." to receive here
in the states. Perhaps most of this was the shipping. I don't
really care if it gets here by slow boat as long as the articles
are interesting technically. I'd like something to replace
"Ham Radio" magazine in my incoming mail, and "CQ" just doesn't
do anything for me. (At least "73" didn't buy it and I don't
have to read Wayne Green's drivel.)

Does anyone on the net get this or know how to get a subscription
to the magazine? I'd appreciate a reply by email or phone. Thanks.

John, WB4LNM

Message-ID: <29400007@uicsl.csl.uiuc.edu>
Source record: 7220

If your IC-745 is like my IC-751, it does indeed depend on the battery to support the operating system, which if lost will require shipping the module back to factory for reprogramming. There is a service note out on the IC-751 which describes supplying +5 dc while the battery is being changed. (The IC-751A does not depend on battery for operating system). The +5 would go to the cathode-side of the diode which connects the battery-positive to the load. The negative would go to the circuit which connects to the negative side of the lithium battery.

I used a different approach which you might like to consider: I left the original battery in place (it still measured the same voltage as a new one), and added a second lithium battery with its own diode....anode to battery-positive, and cathode to load (i.e. cathode of original diode). The two batteries now operate in an "OR" circuit....either or both can supply power when the AC is off.....and can easily be tested, one at a time, without danger of losing anything. A light dummy-load could be shunted across battery for more meaningful test.

WARNING: When soldering, be sure everything is isolated...module removed, or AC cord disconnected (many soldering irons are grounded-tip) which might short out your +5 vdc. A battery-operated soldering-iron would be nice.

Note that with my method (2nd battery), it was not necessary to supply a temporary +5 vdc. If you do use an electric +5 vdc, be sure its neg. is not common to the AC safety ground, unless you are certain that your soldering iron is isolated. As an aside, I remember seeing an article somewhere describing how to reprogram an Icom Receiver (7000 series) which is quite similar to the transceivers. Does anyone know if this might be possible on our transceivers?....or might even the same program work??:

N5AU broke the old USA multi-multi record and beat the group that has
been winning these things lately (W3LPL). We had something like 6600
QSOs, 190 zones and 700 countries for 17.2M or so. Unfortunately for us,
YAECO (Yet Another East Coast Operation) from W2-land was a little more
successful and finished on top. *Sigh.*

Maybe it's time to dismantle everything and move to Joisey.

> I am not "tarring" volunteers in general, just the ones with the
>Ic02ATs and such. Don't change the subject.

I'm not changing the subject. You argue that non-ham volunteers using modified ham rigs illegally is commonplace. It may be in *your* experience, but that does not necessarily mean that it's commonplace throughout the US. I have *never* seen anyone using a modified ham rig on the public service bands in the Houston area, and I've seen a number of the volunteer services around here in action. Your experience doesn't generalize. Please stop acting like it does.

> I didn't attach that appellation to myself - you did. And

>not be reaching me soon. Thanks again!!
> Byon Garrabrant

I have been experimenting with circuits to decode morse on my PC for some time. Let me say right off that the CW decoding part of SuperMorse is not very good. If you have anything other than perfectly spaced NOISE FREE code the output is garbage. I think it somehow interprets noise spikes as dots, and adjusts itself to a very high speed. I never got it to work with my homebrew 'TU'. I ended up writing something myself in Turbo Pascal that is a little more cautious in the way it changes speed, and it works fairly well, although again it has trouble with sloppily sent characters.

I can't send real circuits over the net, but all you need is something like:

SPKR ______> GAIN X 30 _____> precision ________ comparator __>
SOCKET rect
to rs232
input

The other pin of the comparator should be driven from a smoothed version of the output from the rectifier, so you are comparing the current value with the average value. This makes it less sensitive to fading. It could also use some tight audio filtering at the input unless your rig has very sharp IF filters

I drive the op amps from +5 & -5 volts, and this seems enough to swing the rs232 levels, although 15 would no doubt be better.

There are any number of ways you could do this, including PLL circuits but this works for me. I even got it to decode some HF WEFAX pictures by filtering out the 'black' tone & triggering on the 'white' one. Different software of course. If you want any more details, send me mail
Hope you get something to work

2526. Re: Japan's "CQ Ham Radio" Magazine (??)

Newsgroup: rec.ham-radio
Date: 1990-10-30 16:39:56 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <16104@csli.Stanford.EDU>
Source record: 7173

John H. Klingelhoeffer (jhk@saturn.acc.com) asks whether Japan's "CQ Ham Radio" is still in press, and if so, how he could get it.

"CQ Ham Radio" is doing well. Its circulation is one of the three largest among monthly magazines in Japan. Although "CQ Ham Radio" is not the official journal of the Japan Amateur Radio League (JARL's official monthly publication is "JARL News", a puny pamphlet that is widely criticized as an ill side effect to JARL membership), "CQ Ham Radio" is "edited under guidance of JARL". In fact, CQ Publishing has their main office is in the same building as JARL's.

Unfortunately, it costs a fortune to subscribe to "CQ Ham Radio" directly from the publisher (to be precise, from an overseas periodical distribution agency which has sole rights to carry "CQ Ham Radio"), even if you use surface mail. The most convenient way is to buy it at your local Japanese bookstore. This only works if you live in a large city like New York, San Francisco, or Los Angeles. That would cost about nine or ten dollars. The second best way is to ask a friend in Japan to mail it to you. The magazine itself costs four dollars or so, and surface shipping is about two dollars. You'll save on money, but will be asking somebody a favor.

Since you seem to be interested in home brewing, I would recommend "Ham Journal", a bimonthly also published by CQ Publishing. This magazine is much more advanced. Each issue focuses on some particular technical topic, and coverage is fairly deep. This magazine is about the same size as "QST". "CQ Ham Radio" is for finding out the latest equipment. "Ham Journal" is for bulding your own radio. I'm making a modularized SSB tranceiver which appeared on "Ham Journal" several months ago.

Another less known publication that has homebrew information is "Mobile Ham". It started out as a magazine specializing in portable and mobile operations, when bulding small, stable, rugged radios was a major challenge. Nowadays, they deal with advanced homebrewing techniques. "Mobile Ham" is also a monthly, about the size of "QST".

While on the topic, let me add "Radio Life", a popular magazine slightly wider than a paperback book that defies the twilight zone between legality and thrill. This is a must for scanning fans. Lots of "secret frequencies" listings appear in each issue. This is your consumer guide to electronic surveillance. Find out what that couple is doing in the apartment across the street! Want to modify your car so it looks like an unmarked squad vehicle? We'll show you just how to do it -- no more parking tickets ever! In a country where not only third party traffic is illegal, but it is a felony punishable by two hundred thousand yen fine or two year imprisonment or both to merely disclose a frequency used by others for any particular purpose, this magazine has lots of guts. Quite

interestingly, among of its avid subscribers are newspapers and TV stations -- they depend on police radio traffic to miraculously appear on the scene. And even though police radio is now digitized, zealous "undercover monitoring" fans have allegedly cracked the code, bringing in windfall profits to Japan Radio Company, the major supplier of radio equipment to public services in Japan.

Oh well, I ramble too much.

If you have any more questions, please let me know, and I'll respond.

Message-ID: <1705.272d6bfe@iccgcc.decnet.ab.com>
Source record: 7127

On September 21, 1990 the federal court in Cleveland Ohio
filed an order which gave me a battle victory (war not over)
in my quest for a permit to put up a Mosley TA33M tribander
at my QTH in ROCKY RIVER, OHIO.

The judge declared that the "government's strong interest in
amateur communications" was not considered in denying my permit
and therefore the ordinance cited was prempted by PRB-1.

The ARRL has a copy of the order and there will be a note
in the December QST.

We have been at this for four years and it isn't over,
but at this time, it appears close.

I have the text of the order scanned and on disk but am not
sure if this is the place to post a 30K file.

We are in the 6th circuit, federal courts.

We have no CCRs or ordinances prohibiting antennas, there are about 6 towers
and tribanders in this city of 21,000 and it is just a case of the neighbors
having more pull at city hall than the federal law.

During the CQWW, we used it at N2RM. I might mention that N2RM set the US record and won in the US if our final tally holds up under close scrutiny. K1EA was an absolutely indespensible part of the effort. We had 9 stations going. Each BAND had K1EA running and `networked' to all the others <AND> to a PACKET cluster. The PACKET cluster call outs are displayed live during the contest and made a significant difference in our getting 40 zones on multiple bands and I personally credit not only operator skill at N2RM, excellent equipment, but also the efficiencies afforded by K1EA. Logging is a breeze and DUPES need never be entered. If you here a callsign and many are calling and you wish to know if it would be valuable to hang around long enough to get the station, K1EA will tell you whether or not this station is needed on the band you are operating. If you are networked, it will yell at you if a station is called out on the packet cluster and inform you the station just called out is needed AND on what bands. I credit this with 10% of ALL N2RM's multipliers.

N2RM's tally was 18.2 million.

I have no connection with K1EA and used it for the first time during the CQWW. It is worth every cent you pay for it during this kind of effort and I am sure it would be even more valuable to a single op unassissted in keeping records straight.

I tend to use "Y'all" which I got from my Georgian aunt. Being from Southern California, I sometimes mix "y'all" with "radical", "tubular", and other regional phrases.

"Like, oh my gawd, y'all!"

I also teach. While this phrasing sometimes leads to chuckles (and smirks from English aficionados), I've yet to be accused of being sexist or gender restrictive.

"Y'all have to be careful with your power supply bypassing
when you combine 555 timers with other circuit elements
because the 555 uses a big slug of current when it switches."

Peter King

Personally, I'm not wild about putting a live soldering iron inside of a "hot" radio, especially one supposedly filled with CMOS. If I remember correctly, the RAM/battery combination is on a plug-in board, so it can probably be removed and put on the bench for the battery swap. Then all you need is a low current supply to keep the memory alive while you do the battery transplant. I'll take another look in the service manual when I get home tonight to see if there is anything I missed. It really makes you wonder about what went through the radio designer's head; I can see putting the memories in battery backed-up RAM, but not the code for the micro-controller. Thank goodness I still have my Drake twins in case my soldering iron slips :-).

(Richard A Hyde at rah@btr.com writes...)
When I took my code test two months ago (and STILL no certificate!), the VEs DID use a multiple choice test for those who failed to copy one solid minute. In fact, the pre-test instructions included hints like: "listen for key phrases such as "My name is..." We were then supposed to listen very hard for the next letter. If the next letter was, say, M and the multiple choices for the senders name were Martha, Jim, Sam, and Tracy.... well, you can see how it goes....

(Don Perley - KE2TP - writes...)
That is sure different from the test I took last summer. The instructions were emphatic that your fill-in-the-blank answer had to be exactly as sent, or be marked wrong. As an example, if the senders QTH was sent as "paramus, nj" and you wrote "paramus, new jersey", or "paramus, n.j." it would be marked wrong.

In addition, the test leaned towards questions that you couldn't answer from context if you had missed a key character, like "how high was the sender's tower?" (something like 179 feet) or some third parties call sign that was mentioned.
...
==========
My experience with the 13 WPM test a couple of years ago matches what KE2TP saw -- fill in the blank... exactly as sent. (Laurel VEC)

However, I actually took that test before I was really up to a solid 13 WPM -- but I passed by the skin of my teeth even with really ratty copy. The phenomenon noted by Rick above was what saved me. The question that put me over the top was: "What kind of pet did he say he had?" My copy (using "*" as a missed character) read something like: "... ***pet *at. " Figuring "cat" as a better bet than "bat" "rat" or any other "*at", I sign myself

-- "Gary" N3FRS, (Amateur Advanced)

P.S. I went home and unplugged my key. I'm not even sure where it is now.

P.P.S. And I *promised* myself I would never add to the code/nocode noise level... oh well.

2538. Satellite T.V.

Newsgroup: rec.ham-radio
Date: 1990-10-30 19:32:42 UTC
From: norm@tsdiag.ccur.com
Message-ID: <1126@tsdiag.ccur.com>
Source record: 7136
Cross-posted to: sci.electronics,rec.ham-radio,rec.video

A while back I posted for info on Satellite T.V. Video Cipher srambling. The following are three of the best mailings I received out of many. A lot of people asked me to post any info I got so here it is:
(Names of posters have been deleted)
(1)
> I have some questions regarding Satellite T.V. and VideoCipher II.

> 1) How come I never see this subject on the net ?

Touchy topic. CAN be but not necessarily illegal. I like reading about it, but I stay away from actually doing the modifications. Kind of like picking locks - interesting, but it can get you into some real trouble if you go around doing it.

> 2) Did any of you read the articles in Electronic Eng Times on DecTec
> and the new SUN decoder (Oct. 22, 1990)? Does anyone have the address
> of DecTec or info on ordering the SUN decoder ?

NO. There is a unit called "Sync-A-Link" which gets the video on VCII services. There is also a complete VCII clone available in Canada - but it would violate too many copyrights to import into this country. Really, as far as I'm concerned, GI has a monopoly here and that shouldn't exist!

> 3) Whats the latest scoop on VCII decoder hacking, anyone got the 032
> type working ?

032 boards work. They're a bit more difficult. They take different software and different seed keys. They can be converted to 010s with a $100 or so module.

> 4) Can anyone explain the following : Wizard Chips, Seed Key archival,
> Auto Updating units, Musketeering, what services the 900 number provides
> and how is a unit modified for the 900 number codes ?

Wizard (keys): These are the decryption codes for the audio stream. They are called Wizards because one set (18 bytes) gets all audio for backyard subscribable services. There is a new one each month. This is the key "cheat" boxes get - actually all boxes get this number. "Cheat" boxes ignore the service mask that accompanies the wizard code.

Seed Key Archival: Seed keys are 28 bytes of keys that come in RAM in a cypher when you buy it. The way the sysem works is this: the vc monitors the data stream looking for it's serial number. When it sees it, it grabs the block of data intended for it. This data are the Wizard codes and channel mask (usually for next month) in encrypted form. The seed keys are used to decrypt this info. The seed keys are kept in RAM which is

backed up by a lithium battery. These batteries die in about 4 years and then the vc becomes "brain dead" - it forgets it's seed keys and serial number and no longer can receive the services it is subscribed to. Another use (the reason this was done) is that if you give several boxes the same serial number and seed keys, they will get the same services - so you have a "cheat box". Doing this is called "Muscateering". In addition, most Muscateer software ignores the service enable mask so that the original board only need be subscribed to a cheap service.

Auto Update: By having the appropriate seed keys and serial #, you never have to touch the vc and it will continue to get service.

900#: the one you want is: 1-900-HOT-SHOT. For $3.50, this call will give you one of 3 sets of Wizard keys: 010-019, 032, or F3-18 (a service that you can't subscribe to and thus has a different wizard key) You won't need to make this call if you have auto updating software. To use these numbers, you need software that allows you to enter them.

> 5) Which of the VCII's have been cracked (ie: 019, 029, 032) and which
> ones have not.

Cracked: 010-019, 032.
The VC+ (029?) has been reported to have been compromised. It is hard to assess yet, because no (or just recenlty) VCII+ services are available.

> 6) What are the best sources for info on this subject, how about
> Telecode ?

Telecode is OK, but I don't think they sell complete software. They do have a lot of info which could probably give you a good background. After all - this is Educational, right?

> 7) How about the Oak system ?

Can be done. It also requires software - but I haven't taken a look at it.

> Any information would be great! Now don't worry, I would never do any
> thing thats illegal. I just want to further my knowlege on how these
> things work. Thanks, Norm.

I had a chance about 6 months ago to take an 010 apart and see how it works. Rather interesting - but REALLY BAD DESIGN. Easily compromised and the VCII serices was built to fail. (Several parts go bad in 3-4 years. Maybe GI wanted to recycle the boards every so often... but it costs the consumer)
(2)
Receiving unauthorized programming through a modified Videocipher module is potentially unlawful, thus there is reluctance to discuss any methods in a public forum such as this.

What can be said is that the Videociopher 2000 and 2100 models 018, 019 and 032 have been widely compromised by so-called "chippers". Who alter the units' firmware to simulate authorization of multiple services. The compromise is made possible by an extremely poor and

short-sighted design of the DES key manangement by MA/Com, the
original designers of the system.

There have been significant changes incorporated in the newer
Videocipher Plus which are claimed to prevent chippers from
attacking with current stategies. Digicipher, reported to be
compatible with HDTV, is in the works.

Yes, there is a 900 number which reads numbers to you in
hexadecimal format. There is no explanation of what the numbers
are for or what to do with the numbers. I don't think it would be
a very smart idea to call that number from your own home unless you
want the FBI knocking on your door next month.

There are many sources of so-called Videocipher "repair" software.
The best way to find out is to get a copy of a magazine called
"Satellite Watch Newsletter" and read the ads (it is virtually 100%
ads). It's easy to get taken. I doubt that anybody is going to be
stupid enough to go the the postal inspector complaining that
he/she was ripped-off buying illegal Videocipher firmare, but only
recieved a box of a few scraps of wire and some old TTL chips.

(3)
With respect to your questions, I don't think I can be of much help other
than on the subject of the 900 number. I "invested" some $40-50 for
something called a super chip, or something like that, and all that came
was a $0.50 ic socket, and some nearly useless directions and a data
disk that I haven't looked at yet. From what I gather, you must scrape
off some of the epoxy from one of the VCII chips and solder the ic
socket over it. You then use an eprom programmer to program an eprom
to plug into the socket (eprom not included, and no indication of
what type eprom to use). Aparently the data on the eprom must be updated
once a month via the 900 number. I have not tried this so I have no idea
if it works.
Something out there must work, cause they are offering nearly twice
the purchase price for old version VCIIs, and the manufacturer is actively
trying to get people to trade in the old units.
An interesting source of information is on satellite. I'm not
sure, but I think on S1 on Tue or Wed night, ?9 or 10pm est? Some
crazy guy tries to sell used sat equipment for 5 times what it would
cost at a hamfest or flea market, but he is interesting to listen to,
and talks a lot about the VCII situation.

(End)
Well, thats the best information I've received so far.
Does anyone have some more to add to this ?
Remember that fooling around with VCII's to receive scrambled broadcastsiis illegal and you
could be fined and or sent to jail for it! But talking aboutit is not, Norm.

An interesting logical syllogism. Hitler didn't invent guns. Therefore Hitler didn't force guns on anyone. The implications are fascinating.

The crime here is forcing a human being to spend time learning a skill that, most likely, he or she will never really use. From a utilitarian standpoint, that's clearly immoral.

>What elitist crap! Are PhDs from Belcore the only folks with valid
>opinions?

The assertion that CW is "efficient" should not be a matter of opinion; it is a testable statement falling within the domain of information theory. If knowing that is elitism, then ham radio needs more of it.

I invite anyone who thinks CW is really spectrum-efficient to give me a call next time you're in LA. I'll take you over to meet some people from the JPL Deep Space Network. They're the world gurus of weak signals, and they do it all with "Belcore (sic) PhD elitist crap".

And before anyone feels the need to point out that the DSN isn't ham radio, yes, I know it isn't. But CW either is or isn't efficient, and people who understand the question say it isn't. CW does have the advantage that it can be decoded by ear by a sizeable group of people. In other technical respects it's unimpressive.

If you like it, use it and be happy. Don't expect everyone to think your reasons are compelling.

> anything like this one. Surely the last comparable one was 1957, but
> that was before even a lot of us old farts had our licenses.

Sorry, I disagree. Yes, the conditions during the 'test were good.
However, this whole sunspot peak was not nearly as good as the one in
1979, when Japan was worked in New England on 6 meters (I know, I did it),
and Alaska was in for days on end, not to mention the Pacific openings.
I've heard that really good sunspot peaks are really 2 cycles apart, so
expect to see extraordinary conditions again in 2001.

The crime here is denying a human being the opportunity to learn a skill that,
most likely, he or she will use for life. From a utilitarian standpoint,
that's clearly immoral.

Sticking my two cents in here: I have yet to see anyone propose not allowing the use of CW by those who would care to use it. All I've seen so far are people arguing for and against requiring people to pass a Morse code test before being allowed to utilize other techniques on the air.

Have I missed some radical posting(s) urging the banning of CW?

In a previous life I'd like to forget (as WA2TKQ), I worked Australia from
Miami Florida with an HW-8 QRP CW rig using an aluminum window sill as
an antenna. A friend of mine (N2CR) and I won first place in our category
for that contest (which I think was the CQ WW CW contest in 1978). We
operated from a dorm room in Pearson Hall, University of Miami.
Australia was our only contact. Our category was Multiop QRP with
bizarre antennas. Look it up.

2563. Need Modest Public Address System

Newsgroup: rec.ham-radio
Date: 1990-10-31 04:22:07 UTC
From: DBG@SLACVM.SLAC.STANFORD.EDU
Message-ID: <90303.202207DBG@SLACVM.SLAC.STANFORD.EDU>
Source record: 7160
Cross-posted to: sci.electronics,misc.consumers,rec.audio,rec.ham-radio

I need a modest Public Address system for a nonprofit organization with
a modest budget, just something to boost the voice of a quiet president
a bit. Budget limit $300 max.

I thought a nice solution might be a boombox with a mike input, and
bought on trial a Panasonic RX-DS20 with CD player and tape and FM radio,
figuring it could also provide background music for parties etc.
This might work, though I wonder if the 5-inch speakers are up to it.
It seems loud enough but I think I sense a resonance at a few hundred
Hertz which might be annoying, and perhaps it won't be loud enough in
a room with a hundred people. (price $199)

For a microphone, I thought the ideal would be a wireless mike which
broadcasts to the FM radio, and bought (on trial) a Radio Shack 33-1076.
The first one seemed hopelessly distorted, so I exchanged it for a
second which is better but still useless. (price $20)

There seem to be a few problems with this approach. The RS mikes seem to
be no-fidelity. (Are there mikes of usable quality which broadcast FM?)
One part of the problem is the Panasonic receiver is digitally tuned,
and it is very very hard to tune the mike accurately. However, transmitting
to an analog-tuned radio also results in awful fidelity, so that isn't
the whole problem. Second, the FM band is pretty full here so it may be
hard to avoid interference.

Does anyone have relevant experience with PA systems for modest-size
groups? We don't want a bull-horn, and don't need rock-band volume, but
want good fidelity and enough volume to handle say 100 people inside a
community-center-type room (typically hard walls, tile floor, acoustic
tile ceiling).
Is there a convenient clip-on mike with wire connections if the FM
broadcast scheme fails?
Any suggestions for an alternate system? We could do without the
CD player and tape and radio if necessary.

jenkins@jpl-devvax.JPL.NASA.GOV (Steve Jenkins) writes:
>The assertion that CW is "efficient" should not be a matter of
>opinion; it is a testable statement falling within the domain of
>information theory. If knowing that is elitism, then ham radio needs
>more of it.

That depends on what you call efficient.

CW is SLOW. Machine generated and machine decoded CW can do a marvelous job of efficiency, but that is limited to machines only (and certainly does not apply to testing the carbon-based units). The Morse Code itself is inherintly an INefficient code. It requires more bits to send the information, with no means to recover the excess.

When we are dealing with strictly human operators of conventional analog radios, CW definitely has some advantages. But these advantages are realized just BECAUSE CW is not efficient. It is REDUNDANT, and that helps it get through the noise.

>I invite anyone who thinks CW is really spectrum-efficient to give me a
>call next time you're in LA. I'll take you over to meet some people
>from the JPL Deep Space Network. They're the world gurus of weak signals,
>and they do it all with "Belcore (sic) PhD elitist crap".

You can make CW spectrum-efficient, but you could do that with ANY code. Morse (as opposed to CW) is not an ideal coding system for machines, and so Morse code CW never will reach the ideal, but can can be made quite impressive.

But that which makes CW impressive does not apply to test PEOPLE's skills.

>And before anyone feels the need to point out that the DSN isn't ham
>radio, yes, I know it isn't. But CW either is or isn't efficient, and
>people who understand the question say it isn't. CW does have the
>advantage that it can be decoded by ear by a sizeable group of people.
>In other technical respects it's unimpressive.

Machines can decode Morse code CW quite impressively.

Humans can decode Morse code CW, too.

Many humans are not interested in Morse code CW, and think it is not relevant.

Machines don't and can't care, so do go on FORCING MACHINES to do code.

>If you like it, use it and be happy. Don't expect everyone to think
>your reasons are compelling.

Or if you don't, don't use it, and be happy.

But what about the ones who don't want to before they have a license?

And you heard this on a CW net I bet.

This is a totally bogus argument. If by virtue of there being no
requirement, people are deprived of the choice, then we need to
start requiring EVERYTHING THERE IS.

My parents forced me to try a LOT of different foods as I grew up. I found
that I ended up DISliking most of the foods they forced on me. I ended up
LOVING other kinds I never had as a kid (e.g. Chinese, Indian). I do believe
that had I not had these things forced on me, I would not have such negative
feelings about them

While in junior and senior high school, I had literature FORCED upon me by
the English class curriculum. In grade school I loved to read fiction,
able half being science fiction. But after my experience in high school
with literature being forced on me, I ended up so disliking it that I no
longer read fiction at all. It just feels so bad to me to do so.

And you tell me that forcing things on people is GOOD? No way!

>Now here's something you can flame me for...I think the no-code attitude is
>selfish and arrogant. You want to change ham radio in ways that I think will

>I'm just paranoid. But why do I keep spinning the dial down the bands to talk
>with people who make me feel good about what I'm doing instead of feeling
>profoundly embarrased?

Now here's something you can flame me for...I think the pro-code attitute is
selfish and arrogant. You want to keep ham radio stuck in the way of the past
that will doom it. You may have the best of intentions, but I don't think you
know and understand what the future of the hobby has going for it in the next
fifty years. The loss of valuable spectrum we can see each time the FCC says

something is a direct result of the lack of growth because of efforts to keep out anyone not willing to become like you. So what conclusions can I draw? I work VHF, UHF, and planning to go digital, and am also interested in VHF thru SHF SSB and CW and I am appalled by what I hear. How can I not associate a "stick to traditions only" thrust with a knife in the heart of the Amateur Radio Service. I hope I'm wrong. I hope I'm just paranoide. But why do I keep spinning the dial down to the HF bands and hear people who make me feel bad instead of feeling profoundly proud?

>op-amp. If someone has accomplished
>this or knows how to convert the presence of a tone to
>the closing of input pins on an RS232 port, I would be
>forever indebted!

I would suggest that you use a comparator IC (LM-339) as the input to the desired circuit. This can be connected directly to the audio output of the radio and use a voltage threshold to determine where the comparator trips. For a reference on this part, look in the National Semiconductor Linear Databook. The output of the comparator will be a square wave driving an open collector output of the comparator gate. Use a 1 Kohm pullup resistor to your supply on the output to create a TTL-compatible signal. Run this into a re-triggerable one-shot such as the 74122 or 74123, available from several vendors. This is a TTL IC that can be used to stretch a pulse from a narrow width to a wider one. You should pick a time constant value is about 2.5 times the time period of the incoming tone. This will cause the output of the retriggerable one-shot to go high and stay high during the presence of a tone and drop if the tone is missing for two or more time periods. This will will be the desired signal you need to feed into your CPU. Now, you just have to convert from TTL levels to RS-232 levels. This can be a bit tricky, but using a chip such as the MAX-232 from Maxim or equivilent parts from TI or Motorola will do the job. The problem with this level conversion is that you need +/- 15 volts, which is not usually available easily. The chip mentioned has an internal converter that generates the required +/- 15V levels internally and uses it for the RS-232 drivers. It also has some line receivers that convert from RS-232 levels to TTL levels. Finally, connect the RS-232 level outputs to your PC and have some fun!! This project will require 3 chips, two of which are pretty common. The MAX-232 chip may be a bit tough to obtain, but call a Maxim distributor or rep in your area and ask for a sample or two. This circuit will work on 5 volts DC, which I assume you have available for your use.

SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

WD3Q DX-Pedition To Jamaica A Major Success

Eric Rosenberg (WD3Q) recently returned home to his QTH in Washington, D.C. after his AO-13 DX-Pedition to Kingston, Jamaica. Enjoying the hospitality of Hugh Brand (6Y5HB), the only ham in Jamaica on the OSCARs and using Hugh's satellite equipment, Eric gave a "live" demonstration on Oct. 13th to a group from the Jamaica Amateur Radio Association at their club station, 6Y5RA. Included in this group were non-hams consisting of government officials interested in the emergency communication possibilities of OSCARs. During the Mode B session, Eric made 35 contacts with hams in six countries on three continents. During the demonstration, everyone was able to see a map from QUIKTRAK showing the sub-satellite point of AO-13's ground track. The video monitors were made available through the kindness of a local audio-visual company in Kingston. After the AO-13 pass, Eric gave a slide presentation about the current flock of MICROSATs and what is on the horizon for AMSAT satellites. Also, during his presentation, DO-17 pass came by and using the WhatsUP program, decoded several frames of telemetry "real-time." After the demonstration and presentation, several hams indicated that they would now start on working to become active on the OSCARs. For those lucky few who made a contact with 6Y5RA, you can send your QSL to WD3Q, 338 14th. St., NE, Washington, D.C., 20002.

S-BAND OSCAR SPECTRUM THREAT

HR AMSAT NEWS SERVICE BULLETIN 300.02 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

Potential Loss Of OSCAR S-Band Spectrum Looming On The Horizon In WARC-92

The FCC has released a 150 page document known as the "Second Notice of Inquiry (NOI)" which outlines the U.S's proposal for the World Administrative Radio Conference (WARC) to be held in Spain in February '92. It outlines several different plans to reallocate the spectrum in the Amateur Radio Satellite service in the frequency range of 2390-2450 MHz. At the recent AMSAT-NA Space Symposium in Houston, TX on Oct. 20, Jan King (W3GEY), AMSAT-NA VP of Engineering, expressed his feelings about the devastating affect this

would have on future OSCARs. In what is a very complicated issue, radio amateur use of this portion of the 13cm spectrum would cease so as to accommodate land-mobile systems radio. Also, there is even more pressure to take this spectrum away from radio amateurs by digital audio broadcasting concerns who want to deliver compact disk quality sound service via satellite. In the next couple of weeks the AMSAT News Service (ANS) will be providing more information about this US WARC-92 proposal found in the FCC's General Docket 89-554, paragraphs 84-105.

Recent AMSAT-NA Board of Director Appointments

At the AMSAT-NA General Meeting held the weekend of Oct. 19-21 in Houston, TX, the AMSAT-NA Board of Directors (BoD) elected the following individuals to serve as officers of the organization for the coming year:

Doug Loughmiller (KO5I) President & General Manager
John Champa (K8OCL) Executive VP
Ray Soifer (W2RS) Senior VP
Drew Deskur (KA1M) VP Special Projects
Jan King (W3GEY) VP Engineering
Courtney Duncan (N5BF) VP Operations
Jeff Wallach (N5ITU) VP Field Operations
Andy MacAllister (WA5ZIB) VP User Services
Bill Tynan (W3XO) VP Manned Space Operations
Art Feller (KB4ZJ) Treasurer
Martha Saragovitz Secretary

The AMSAT-NA BoD has created a new position known as the VP Publications but at this time nobody has been selected to fill this position. Please stay tuned to ANS bulletins next week about further announcements of appointments made by the AMSAT-NA BoD.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 300.04 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

03 Nov 90 98 J/L 1500 N5BF WD0E Saturday
10 Nov 90 96 J/L 1835 WA5ZIB WB6LLO Saturday
17 Nov 90 145 B 1300 KA5SMA WB9ANQ Saturday
24 Nov 90 97 J/L 1430 WD0E N5BF Saturday

Nets are scheduled for North American geographic coverage and time zones
although other parts of the world are often within the footprint and check-ins
from everywhere are welcome. Those who don't have adequate and convenient
coverage from this net are encouraged to schedule their own nets via AO-13.
Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate,
contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone
(301) 589-6062, or contact your local AMSAT Area Coordinator.

FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 300.05 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040
This schedule is expected to continue through 26 Dec 90.
The Command Stations have oriented the spacecraft to an attitude of:

BLON = 180 and BLAT = 0

Further attitude refinement may be performed.

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel
illumination to support Mode-B transponder operations. Both beacon and
transponder signals show signs of FMing. Until further notice please DO
NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar
illumination to support Mode-B transponder operation by sometime in November.

Command Station Development Programs Announces Two Promotions

Bruce Rahn, WB9ANQ, AMSAT Command Station Development Program (CSDP) Technical Coordinator is pleased to announce the promotion of the following individuals to Level-1: Tom Davis, KB7HTA, and Dusty Warner, KF4AU. To be promoted to Level-1 in the CSDP, an individual must demonstrate the ability to receive, reduce, and analyze telemetry data from a significant number of operational amateur radio satellites as well as the ability to work with other people in support of on-going and future AMSAT projects. Tom and Dusty are to be commended and congratulated on this significant accomplishment.

Additional information on the CSDP may be obtained from Bruce. Please send a SASE with one unit of postage to him at 410 Coronado Trail, Enon, Ohio 45323.

FO-20 CONTINUES OPERATION

HR AMSAT NEWS SERVICE BULLETIN 300.07 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT

Both Transponders Operational during Fever

Command stations for Fuji-OSCAR 20 have turned on both transponders (JA and JD) of the feverish satellite. It has been determined that transponder operation has little effect on the internal battery temperature and so it was decided to leave both transponders on. FO-20 has been in a non-eclipsing orbit since mid-August which means that the satellite is constantly in sunlight. The battery temperature has risen to about 40 degrees C (normal operation should have the battery temperature between 0 to 5 degrees C).

The command team for FO-20 will be constantly monitoring the telemetry from FO-20 and may, without warning, turn off the transponders if it is deemed necessary for the satellite's well being.

AMSAT SYMPOSIUM HUGE SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 300.08 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 27, 1990
TO ALL RADIO AMATEURS BT
Largest Turnout Yet for AMSAT Space Symposium

The Johnson Spaceflight Center (JSC), near Houston TX was the site of the 1990 AMSAT Space Symposium and was deemed an unqualified success by its over 225 participants. The JSC Amateur Radio Club (JSC ARC) sponsored the event which took place in the JSC Visitor Center Auditorium. 22 talks were presented over the three day event. Subjects of the talks ranged from an update on the Microsat operation, to beginner's sessions on what it takes to operate through a satellite, to a look at possible new satellite projects AMSAT may take on. Ron Parise WA4SIR, along with Lou McFaddin, W5DID, presented a talk on the Shuttle Amateur Radio EXperiment (SAREX) program. Lou spoke on how the concept was developed and "sold" to NASA management. He also brought some of the prototype and flight hardware to be used on the STS-37 flight (which will have at least 4 hams on-board). Ron spoke of his mission on STS-35 and how

the amateur operations will be "fit-into" his mission time line.

Saturday evening offered a taste of southern hospitality and cuisine at the JSC Recreation Center. A Texas Bar-B-Q Dinner was enjoyed by the participants which was followed by the AMSAT Annual meeting and Awards Presentation. After Sunday morning's talks, a number of attendees toured the station of Dave Blashke, W5UN, the site of the largest two meter EME array (see Jan 1989 pg 15 for a picture of the site). After Dave demonstrated "armchair" copy of SSB signals off the moon, he was presented an award for his work to rescue DO-17 (DOVE) from a condition which prevented "modestly" equipped command stations from issuing commands to DOVE.

The JSC ARC (W5RRR) has a permanent satellite station in the Visitor Center's lobby area which was used to demonstrate PACSAT and AO-13 operations. A number of attendees were also able to take advantage of the public tours of the JSC which took them into Mission Control as well as other points of interest at the facility. The AMSAT Board of Directors met that same weekend to discuss pressing AMSAT business and to set a direction where AMSAT would head as it looks to the next century.

AMSAT wishes to thank Bill Tynan, W3XO, Chairman of this year's Symposium Committee, as well as the JSC ARC who put together a well organized and exciting program. They are to be commended for all their labors which resulted in the finest AMSAT Space Symposium yet.

2574. Questions on ground for HF verticals

Newsgroup: rec.ham-radio
Date: 1990-10-31 12:46:49 UTC
From: eakin@rsmas.miami.edu
Message-ID: <10416.272e8f79@rsmas.miami.edu>
Source record: 7071

In my search for the perfect ground floor condo vertical, I have come up against a question. Being inexperienced with HF verticals, I'm wondering how well earth ground really works.
I can probably bury a limited amount of wire, but not nearly the length required for 20-40m radials.

Basically, would I be better off mounting the vertical on the ground rather than adding, say, 10-20' of elevation?

How well will ground mounting work to eliminate the need for radials?

Thanks,

73 de Mark

Richard Kronstad---I have the manual that came with the HQ-129X, which is a receiver not a transceiver. lI would be glad to send you a copy. It isn't very long.

While we are on this topic, does anyone on the list have a suggestion for a place to buy/sell old tube equipment like the HQ-129X, Hallicrafters, etc.? Thanks for suggestions.

Message-ID: <9010310820.aa14336@crdec8.apgea.army.mil>
Source record: 7072

This is in response to a posting by Mark. I have a similar problem.
The solution: The Ramada Resonator- an article in 73 about 5 years
ago.

The antenna consists of a Slinky (about $4.00- if you can still find the
metal ones) elongated along a piece of PVC or wood. Feed it like a random
wire from your tuner. Be sure to use a counterpoise ground, as a minmum.
I have also fed it with coax, with the shield going to a "radial" which
I through around the backyard.

The antenna loads from 160 to 10m- gets a little finnicky (High Q?) on 80
and 160, and a little hot on 40- I can probably fix this by changing the
length of the feed wire.

For a ten buck investment, I am on the air and work DX with it from my
antenna resticted townhouse. This might be something worth looking into.

Peter J. Stopa, KA3LKQ
U.S. Army Chemical Research, Development, and Engineering Center
Aberdeen Proving Ground, MD.

The usual disclaimers apply. These are my opinions and not those of the DOD.

Here is proposal that may actually accomadate everyone, CODE and
NO-CODE

The following licensing idea came to mind after reading all of the
notes in this file about the "Communicator Class" and "Incentive
Licensing"

We could actually use our current system (already in place) and
accomplish much of what everyone here has said or commented on.

The goal of this proposal is two fold:

1. Entry Level --- to get more young and non-technical people
into this hobby.

2. Have those already in the hobby expand their knowledge of the
various aspects of this hobby.

3. Make the administration of the licensing procedure less complicated.
(not sure anything the government does is not complex)

Class Elements Options

Novice 2 CW 5 WPM

Technician 2,3a Pick (1) from list below

General 2,3a,3b " " " " "

Advanced 2,3a,3b,4a " " " " "

Extra 2,3a,3b,4a,4b " " " " "

Communicator 2,3a * (required)

Option List: (Aside from the code Exams these tests will be 25-30
multiple choice questions designed in the same manner
as we have our tests designed today however the pool
of questions should not be made public)

a. Packet
b. RTTY
c. CW 10 WPM
d. CW 15 WPM
e. CW 20 WPM
f. Microwave
g. Emergency Service / Operations
h. Net Operations / Control
i. SSTV

j. Community Service
*k. UHF/VHF Operations
l. Satellite

(The above list is not all inclusive)

All current allocations and privs remain the same.

All current licenses are grandfathered.

If the the current proposed Communicator Class is approved the 5 WPM Code will be required for upgrade to Technician. (this assumes that the VHF/UHF privs are different for Technician and Communicator.

The desired results here are that:

1. Everyone can get into the hobby.
2. Those with higher levels of license have a good background into more of the hobbies aspects.
3. We can maintain the same licenses structure and have it mean more to be a certain class then it does now.

> Pete Lucas PJML@UK.AC.NWL.IA 0793-411613
>
>
I have had limited experience with this. My 1974 Volvo 174 once had a
problem with the fuel injection shutting off every time I keyed the mike
on my 2M rig. It turned out to be a bad control unit. The unit was
made by Robert Bosch, if I remember correctly. I had contacted the
local Bosch facility and they promised to get information and get back
to me; they did not. However, I replaced the unit and the problem went
away. I was told that they did not have adequate RF shielding in 1974,
but as of 1975 they addressed the problem. I went to an independent
Volvo mechanic who diagnosed the problem and even told me to replace
the unit myself rather than pay him labor to install it; he purchased
it for me and he took the old unit to return.

When I had the 2M rig in our 1984 Volvo 240 there was never a problem.
My 1988 Toyota Supra is loaded with electronics and computer controls. I
have not yet had a problem at low power or at 45W with my Icom 27H.

I would suggest you check other Volvo dealers and any independent Volvo
service facilities for advice. Remember to route the power lead and radio
as far from electonic components in the car as possible, as well as the
coax to the antenna. Check a service manual to see where the components
are located. Also, it is claimed the best method is to hook both the
positive lead and the ground directly to the battery (I believe Volvos all
have a terminal block near the battery where you can connect the leads). I
ran the hot lead to my battery in my Supra, but ran the ground to a chassis
ground under the center console where the radio is mounted.

However, manufacturers should really have information on RFI problems and
solutions. I believe I once read where GM does have information on radio

installations. You might also want to contact area companies that specialize in installing commercial radios in vehicles. I am sure they would have solutions to the problem. I don't know if the FCC has any regulations covering RFI problems in cars, but you might want to contact them just to see.

Good luck,

This is the crux of the whole debate right here in two statements.

How is NOT REQUIRING CW the same as DENYING THE OPPORTUNITY TO LEARN CW??

The No-Code people are advocating it's elimination from the test, not the
banning of CW. The Pro-Code people equate non-testing with forbiding it's
use.
If anyone wants to learn it, fine, but I still haven't seen any LOGICAL
reason for making everyone do it.

bill KB3YV
(^^^^^ see, I passed the CW test and I still don't think everyone
else should be forced to.)

"COMMUNICATIONS QUARTERLY" is comming. To assist you who are wondering what this shot at filling the void left by the demise of HRM will be like I have talked with Terry Northup the editor and have asked her to fax me a copy of the table of contents from the first issue. As soon as this arrives I will post same to these newsgroups. From talking to Terry things seem to be really exciting there with lots of GOOD articles in the works. (I need to get version 3 of PARHFINDER to her) Her comments on the magazine specificly are that we should see MORE THAN 100 pages of technical articles per issue. There will be NO ads mixed in with the articles but there will be ads.

Stay Tuned for further developments.

I'll offer to buy any FT470 under Scott's conditions for any number of
radios. :-)

Seriously Scott, these terms are wildly out of line. For $200 you could
get a working, but cosmetically flawed, IC2AT, but not a FT470 in working
condition. The FT470 is extremely popular and in high demand. If you find
a used one for under $325 you can be sure that there is something wrong
with it or the seller is totally ignorant of the marketplace. Written
warranties between private parties are extremely rare, but most sellers
will warranty that the radio works at the time of sale. Buyer Beware
is the watchword.

>except yourself?

No one has proposed banning CW operation. They have proposed not requiring
Morse testing for certain license/frequency operation. Their attitude is
inclusive of people who want to use modes other than manual CW and of people
who do want to use manually decoded CW. Nothing in their proposals prevents
an individual from voluntarily learning to manually decode CW. Your attitude
is exclusive of all people who do not desire to use manually decoded CW
modulation. Can you see who the bigot is in this situation?

>So: If there are more people who want to keep it than don't, you lose.
> If there are more prople who want to trash it than don't, you win.

Actually the FCC won't put it to a vote. Their duty is to decide what
rules best promote the charter of the Amateur service. Whether the decision
is popular with current licensees is only one factor in the process. They
must consider the impact on potential licensees as well as current licensees.
Their primary concern is good public policy, not protecting vested interests.

> > >tax exempt. How many hams do you think would contribute to a non-tax-exempt
> > >ARRL lobbying fund?

Well, lobbying is defined as attempting to influence legislation. I suspect that the NRA Political Action Fund is used to influence _elections_. A 501(c)(3) organization (such as ARRL) can do lobbying as long as they don't devote a "significant" amount of their resources to it. But there are other classes of non-profit organization. (I'm no expert: that exhausts my knowledge of the subject.) Note that attempting to influence _regulation_ (e.g., FCC Rules changes) is _not_ considered lobbying. ARRL can, and does, put significant effort and resources into that. Fortunately, it is regulation that is usually what we need to influence. Not much legislation has a direct impact on ham radio, so the need for actual lobbying is small enough that we can do it. As for PAC activities, amateurs could never dig deep enough to compete with the campaign contributions of, oh, say.... UPS, for example. We'd be outspent by just about anybody, so it's better to stay above the fray, so to speak.

> I think you'll find that ARRL is a lot goosier about losing their tax status
> and is probably playing it safe. Let's face it, if they had to start paying
> income taxes on the publishing empire, they'd be in real deep trouble.

I don't know if I'd call it playing it safe so much as making an informed decision as to the most effective way of having the kind of influence over governmental actions that we want to have. Getting into the gutter (my characterization, not ARRL's) with the other PAC players and the industry groups would simply probably not be effective. We have a lot of friends in government who consider ham radio to be a "pure" public interest. As soon as we show up with a roll of bills in our pocket (figuratively), we lose that good will and become just another special interest.

How well the earth works with your vertical depends on your location. In Miami, you may have dry sandy soil (awful) or soil dampened with sea water (ideal).

In my location, mounting the vertical on the roof with four 1/4 wave radials strung out to neighboring trees worked much better than earth-level. It was a Butterfield six-band vertical with their radials tuned one per band for four bands. The earth was your usual Northeastern topsoil lawn.

However, there is no way of telling WHEN or IF it will be used. I don't use CW on the ham bands today. I can't say, nor can anybody else, that I will NEVER use it. In fact, I DO use it -- aircraft navigation transmitters ID in CW. It is nice to be able to recognize what station you are receiving without having to stop and think about it.

Would you rather that the user learn CW only AFTER he decides to get on the frequency?

Two fallacies. One, that no-code denies the opportunity to learn CW -- far
from it, and if it's worth learning, people will learn it. Two, that CW
will most likely be used -- the vast majority of ham communications lies
in voice modes.

Just one problem: Slinky is made of steel, not your best conductor of RF--in fact a terrible one--that's probably why it gets hot as you go to higher RF. Result: a poor antenna at best, is made even lossier than it needs to be.

Better you should use copper clad steel wire which can also be fashioned to act like a Slinky. Most electronics houses carry this wire, which is normally used for wire antennas because of the added strength of the steel core..

>groups"? (Oh, no! I've dated myself!)
>
> - Jerry Kaidor, KF6VB

Gawwd. First we have to hold to the 5/13/20 wmp distinctions even
through it is NOT required by international convention which
requires only 5 wmp for HF work. Now we have to prove how macho we
are by ""One minute solid copy of random code groups."

The thing we must not forget is that ham radio is dying and we will
lose frequencies if we don't get more growth. Most of the Hams are
over 40 years old, silent keys and people who don't use or don't renew
probably outnumber each year's new hams, and we are getting a pathetic
number of young boys and girls coming in.

Since we have to have code for HF according to international
convention, let's drop all code requirements to just 5 wmp, and let's
update the written exams by excluding the kinds of questions and
formulae that one would look up anyway if needed (like time constants,
polar coordinates, etc.), and let's add lots of questions on operating
procedures, packet, etc.

>well earth ground really works.

If you mean using a ground rod--nearly worthless--except for lightning
protection.

>I can probably bury a limited amount of wire, but not nearly the length
>required for 20-40m radials.
>

There is nothing carved in granite that says radials need to be some
certain length. Quarter wave length radials would be nice, longer
would be even nicer, but for limited space, make up for length by
using more of them. Nor need they all be of equal length.

Radials do two things for a <= 1/4 wavelength vertical:

1. Reduce loss. Here is where the use of many short radials
will help to overcome the inability to provide long ones.

2. Lower the angle of radiation. This is desirable for long
haul DX; undesirable if all you wanted to do is talk to your
friends in the next county as you have lowered your sky wave.
But, (you knew there was a "but"?) here is where LONG
radials do their work, and the longer the better, if DX
is your object.

BTW bury 'em if you have to, but an inch is deep enough.
Beyond that losses will ensue--particularly at higher RF.

>
>Basically, would I be better off mounting the vertical on the ground rather
>than adding, say, 10-20' of elevation?
>
Doesn't make a lot of difference (except for construction) below
the 20 meter band. 15 meters and above, going to higher elevation
is advised.

>How well will ground mounting work to eliminate the need for radials?
>
Radials should never be eliminated. I often wonder why so many
amateurs, even those not limited by geography, resist the idea
of radials for a vertical. These same amateurs would not
consider for a moment putting up a horizontal antenna with
a 1/4 wavelength on one side of the "center" feed point

and something considerably less than that on the other side.

Yet that is exactly what the situation looks like to a
1/4 wave vertical with a less than ideal ground plane
(with an added loss penalty, besides).

Steve, N2IC/0, asked me to post this:

As long as we're into bragging ....

K1AR (multi-operator/single transmitter):

4445 QSO's
170 Zones
706 Countries

11.2 M points - a new USA multi-single record !

This was done using K1EA's station, and, of course, CT software (written by K1EA).

A few relevant comments:

- The YCCC packet network had over 3000 DX postings during the contest.
- K1EA's station had the least amount of inter-station interference I have experienced at a multi-station. Ken sure knows how to build stations !
- We were beta-testing an Alpha 87A, automatic bandswitching/automatic tuning amplifier. What a great box for the multiplier station !

The operators were: K1AR, K1EA, KM3T, N6BV and N2IC

WHAAT??!? Bob McGwier, the DSP whiz is into HF CONTESTING??!?!?

I see all the posts on here from folks who want to dump the code, and
say they are only interested in being on the "cutting edge" of technology.
They usually characterize HF contests as a "waste." Now we find out
that N4HY, besides being on the frontier of new ham technology, is
also particitpating in the CQ Worldwide DX Contest!

Gosh, it's nice to see that Bob has broad interests in radio.
(Bob, I am not flaming you!) :>

This month I'll be listening for PHIL KARN in the ARRL Sweepstakes!

Great showing in the CQWW, Bob!

Part 97 clearly states that "the applicant must demonstrate a proficiency in Morse Code." Clearly, in order to obtain a license, I am forced to learn it. The implication which you're attempting to make is that "nobody forced me to obtain a license, so therefore nobody forced me to learn morse code", is a bad syllogism.

>Assuming that you are in college (From your usenet address) or work
>there, I can just imagine that you are only taking classes (or have taken
>them) that you will use in the future eh?

As a matter of fact, 1) I happen to be a student, and 2) I am taking some classes at the moment. I lay claim to the fact that I've never complained about having taken a "useless" class in my nine year (so far) academic career, simply because I consider everything I've taken to be of utility. In contrast, Morse Code does not meet this test; it is 1) a manual skill and not an academic pursuit, 2) a skill of questionable utility, a judgement that I have not made lightly -- you will recall that up until two years ago I did not support no-code.

The fallacy here is to assume that all pursuits have equal qualitative merit. For example, do you assume that learning to wash a floor and learning to design an amplifier have equal merit?

Hey, Gary! I think you missed one. But maybe you classify it as one or the other of the above two you mention. Could you tell me which?

A system that (typically) uses technical access controls and is stated as being open to all. However the access controls are periodically changed and/or individualized. They are NOT published in the open, but are given to any ham who asks, though not over a radio frequency. The exception is that when someone abuses the system (leaving the definition of that out for the moment) their access is terminated my one means (changing the access codes and not telling this abuser) or another (disabling his individualized access codes).

I am planning for my NON-REPEATER autopatch to have access codes like this. Unlike a repeater, it will be relatively easy on the users to have to enter a DTMF access code of 5 or 6 digits that is their specific one. The controller I am looking at getting is one intended for commercial use with paying customers and has this individual capability.

>
> Communicator 2,3a * (required)

Why not....

Class Elements Options

Novice 2 CW 5 WPM

Technician 2,3a Pick (2) from list below

General 2,3a,3b " (4) " " "

Advanced 2,3a,3b,4a " (6) " " "

Extra 2,3a,3b,4a,4b " (8) " " "

Communicator 2,3a * (required)

[list in previous posting]

But then do we even need communicator?

This proposal, however, has problems:

1. A tremendous new burden on the VE/VEC's to develop more tests (but
I actually believe we need to revamp the who testing anyway).

2. The issue of international requirements for a Morse exam for access
to frequencies below 30 MHz.

>there, I can just imagine that you are only taking classes (or have taken
>them) that you will use in the future eh?

Have you been hiding for the past several years? The issue is whether or not a Morse Code test should be a part of every possible means to get access to a public resource, part of which does not have any need of that skill whatsoever.

Here is this public resource, the amateur radio spectrum. Many people would like to make use of this spectrum for reasons consistent with the designation of this spectrum allocation. Some people hold the belief that no one should be allowed any access to this spectrum at all unless they conform to a certain set of radio operator skills, notably the skill to copy by ear the Morse code telegraphy code. This is a skill, albeit a worthy an honorable personal achievement, that no longer has the appeal it once had since so few other services use it anymore.

This is all occurring at the same time that other radio services are experiencing tremendous growth patterns and have a level of spectrum crowding within their own service allocations many times the density level of that portion of ham radio that most closely mimics their usage patterns, voice repeaters and packet radio. From the point of view of almost everyone outside amateur radio, we are wasting this resource.

If we really are not going to make full use of the spectrum we have, then we should just turn some of it back over to the FCC now and just keep what we can use.

On the other hand, we don't have the numbers yet to make full use of what we have. A great number of the 488000+ hams are either inactive or are primarily users of HF (whose threats are more political than numeric). There are too few hams to hold down the vast spectrum we have in the VHF, UHF, SHF and EHF areas. We need those numbers if we are going to keep this spectrum. Perhaps we only need to double the number of hams now on these upper bands. That's not doubling the 488000 figure, but rather a doubling of just the small portion that is there now. If all of the 488000+ hams were activated and operated on the VHF UHF bands, we would no longer have this threat. But that is not every hams interest.

Then there is the issue of whether or not the government should be
letting those who happen to have use of the spectrum now dictate the
measure of how to let others access that spectrum in the future.
If we don't straighten ourselves up, we may find someone like Congress
doing it for us, their way.

I don't use CW either. But I can't copy anymore anyway, so what does it matter for me. I think there are a LOT of hams like me, who have just forgotten the code because they learned it just enough to get by the test (and 5 WPM is nothing but a token effort). Many of those who are not getting into ham radio are avoiding it just because of the stupidity of even a TOKEN effort to learn something they will not and probably cannot use.

> Would you rather that the user learn CW only AFTER he decides to get

I'm on the frequency, but if I am going to relearn CW, it obviously is going to be AFTER, since it is already AFTER.

> However, there is no way of telling WHEN or IF it will be used.

Not true. A simple statistical study of time usage of each mode would give
a fairly accurate probability of use.

Personally, my probability of use of CW is less than 0.05 empirically from
my home station, and less than 0.01 from W6YX. On VHF, it's about 0.05,
and above VHF, zero. That's based on about four years of operation.
Projecting into the future, my use of CW on HF will continue to decline
(most of my CW QSOs were early on when I had a tech license), but will
probably stabilize at VHF...

In contrast, nearly 90% of all of my study time for the exams was spent
learning CW.

Could this be because you talk mostly to CW operators? Most of the posters
to this net who support mandatory Morse testing claim that Morse is easy
to learn and that anyone can do it. When you poll people at a Baptist
tent meeting, most of them will tell you that only Baptists are going to
heaven. If you poll the general population, you will get a different answer.
The fallacy of polling amateur operators about CW is that you are polling
a self selected sample and are ignoring all those who tried to become
amateurs but failed due to the Morse requirement.

>Now here's something you can flame me for...I think the no-code attitude is

>I'm just paranoid. But why do I keep spinning the dial down the bands to talk
>with people who make me feel good about what I'm doing instead of feeling
>profoundly embarrased?

I think you are wrong. The deterioration of good manners among younger people
is a reflection of society in general that has nothing to do with CW. Remember
that all the bad operating practice that you hear today is from people that
HAD TO PASS A CW EXAM. In fact some of the worst offenders hold Extra class
calls.

One of the reasons that the operators in the CW subbands are marginally
more mannerly is that many of them are older and were raised in a more
mannerly society. Another reason is that the communications rate is so slow
that real flamefests are hard to maintain.

Amateur radio needs explosive growth in the UHF and Microwave spectrum to
have any hope of holding on to these allocations. Amateur radio needs a
"critical mass" of operators in the UHF/SHF bands to support real computer
networking. US society needs more people with an interest in technical career
fields. Hooking more people on a technical hobby is instrumental in steering

them to a technical career. Saddling potential recruits with a requirement to learn a mechanical skill most of them consider mere hazing is counterproductive to these goals.

I consider it neither selfish nor arrogant to be willing to accept crowding and some obnoxious behavior on my favorite UHF/SHF bands as part of the price of achieving the goals of saving the bands for amateur use and interesting more people in technical pursuits.

>want good fidelity and enough volume to handle say 100 people inside a
>community-center-type room (typically hard walls, tile floor, acoustic
>tile ceiling).

There are numerous tradeoffs in a PA system. The fidelity/cost tradeoff
is one of the toughest. First let me urge you to avoid wireless microphones
if possible. Good wireless systems with diversity receivers and using
crystal controlled clear frequencies (requiring a license) are very expensive.
Nothing less is satisfactory except in rare conditions. Without diversity
reception you will have null zones with sudden fades and odd noises. Without
crystal control you will have drift problems similar to those you described.
Expect to pay upwards of $1000 for a decent wireless microphone system.

If possible use a podium mounted stick mic such as an Electro Voice EV635, this
is the best all around microphone you can buy. It's extremely rugged, you
can drive nails with it, and it has good voice fidelity. Most broadcasters
use it. If the speaker must move about, use a lapel mic like a Sony ECM50 or
let him hand hold the EV. Using a hand mic properly is a skill that some
speakers find difficult to master. These are professional microphones in the
$50 to $90 dollar class.

For a hall holding 100 people you need an amplifier of about 50 watts.
With very efficent speakers you can get away with 20 watts. You will need
an equalizer to balance the system and prevent feedback. Bogen makes a
suitable amp for about $150. If the PA is to be a permanant installation,
ceiling mounted speakers sprinkled about the hall are best. No one gets
blasted and people in the back can hear clearly. Cost will be about $10
each for 5 inch ceiling mount speakers and 70 volt line transformers.
Otherwise you will need two or three floor standing speaker cabinets. If
you want good fidelity, and you do else feedback becomes very difficult
to control, these can be very expensive. Expect to pay at least $150 each
for floor standing speakers. You can make suitable speakers yourself out of
plywood and speaker components by EV or even Radio Shack. Cost about $50 each.

An empty hall and one containing 100 people have very different acoustics.
Try to get some volunteers to sit in the seats while you are equalizing
the system. Otherwise you will be unpleasantly surprised. Also a system
that sounds plenty loud in an empty hall will be inadequate when sound
absorbing bodies are present. Try to do all your testing with the hall
filled.

So with care you can put together a system for around $300 that will do a fine job. Get to know your local sound reinforcement technicians and the distributors where they shop. You'll learn a lot.

The outcome of the PJ9W vs. PJ1B competition is an example of how operator skill and team rhythm can overcome hardware factors. The PJ9W crew put on a tremendous effort and are to be commended. They had on the order of 100 operators/workers on Curacao and very impressive hardware, including a FULL-SIZE 3 element rotary yagi antenna for 75 meters.

Why they lost I can't be totally sure. And in the grand scheme of things it doesn't really matter. But I know many of the ops who went to PJ1B and I know they know how to operate. Additionally, they have operated from that part of the world many times more than most of the Finnish ops who were at PJ9W.

Both the PJ9W and PJ1B multi-multi teams are to be commended for two fine contest efforts! The CW competition should be an interesting one!

> YAECO (Yet Another East Coast Operation) from W2-land was a little more
> successful and finished on top. *Sigh.*

I just want to congratulate N5AU on a fine second place finish in multi-multi. The team down there has worked long and hard building towers and some impressive antenna hardware....way to go! Obviously the operator crew had a lot to do with the success. :-)

I've helped build and operate both the top finishing station (N2RM) and the third place station (W3LPL). Both of these stations have impressive antenna arrays but antennas alone don't win contests....operators and the way they work together are what's really important. I've participated in some not so successful multi-ops and some *very* successful multi-ops......it's all in the operator chemistry.....

This past weekend I had the pleasure of operating with Ken K1EA, John K1AR, Steve N2IC, and Dean N6BV in a multi-single effort at K1EA's house.....we broke the old multi-single record (6.9M) with a score of about 11.22M. As I page through the log all I keep seeing is passed multipliers....that was one of the big keys to our success....we'd work a station on one band and pass to another band right away or as soon as that station could get to the other band....CT is indispensible for knowing who to pass and where. The other key to our success was the ability to run high QSO rates and to hear the weak ones using stacked yagis on 20 through 10 meters.

We all agree that the '90 WW SSB Contest was one of the highlights of our operating careers!

I think that it would be much more valuable if every ham were forced to pass a CPR exam instead of a CW exam in order to get his license. CPR is certainly of greater potential value to the public than CW ever will be, and it's just as relevant to technical development. More relevant, if you're working with high voltages.

Oh, you don't think CPR is valuable, eh? Then stop pounding that old "Service to the Public" drum.

Not that you couldn't learn both, of course. But if I had to pick between the two as a licensing requirement, CW would lose.

Keep the dipsticks out, too. At least as much as CW has. :-)

The October 1990 issue of '73 magazine has an article on a hardware/software
sharware product called "Robo-Copy".

There is a schematic for building a receiver -> PC serial port interface
and an address for the software.

You can receive the Robo-Copy program (and it's 'C' source!) by sending
$5.00 + SASE + 1 formatted floppy (5" or 3" your choice) to:

Mike Hansen/WN9DYI
1405 Tanglewood Drive
Algonquin, IL 60102

Robo-Copy, a descriptive text file, and the 'C' source are also available
from the '73 bbs under the 73MAG SIG. The bbs number is (603) 525-4438

Robo-Copy is not copy protected and may be copied and distributed freely
for private use only [so says '73 magazine].

I'm attempting to interface this code to a Farallon MacRecorder (for the
Mac, of course). Should I ever get some free time, I'll post my results.

Rick

Hmmm... I can't figure out how to choose vi as my editor, and I have no foggy clue how to really use Emacs, so I can't edit the above down any. I promise I'll figure it out before I post any more.

Any way, its nice to see so much discussion of the contest, seems there are quit a number of fairly serious contesters on the net - we need more discussions of a number of contesting-related topics (after I learn how to edit better!).

As for PJ9W and PJ1B, I think Dave is right on the money, but there is another factor directly related to the hardware which may have had a much greater impact than you might believe. When we set the record at P40V and beat PJ1B that year, their antenna system looked much superior to ours on paper, yet ours worked much better. The P40V system consisted of 4 over 4 on the high bands, at no more than I think about 70', while PJ1B had much taller towers. The difference was that on the high bands we had our stacks split. Our top antennas were rotatable, but the lower antennas were fixed on about the W7/W0 boundary. Virtually the

whole contest the top antennas were pointed at Europe, and we fed both top and bottom in phase (in fact we didn't even have the capability to switch to just top or just bottom). The antennas had also been tweaked to have maximum forward gain and virtually no front/back.

What we had, in effect, was gain equivalent to maybe a good 3 element beam all the way from the west coast to southern europe, and the equivalent of a dipole off the back.

On the other hand, that year at PJ1B they didn't split their stacks, so they had to point at either North America or Europe, losing a lot of contacts from the other in the process. I don't know for sure, but I'd bet money that PJ1B learned the lesson that its better to be very loud in a lot of places than to be extremely loud in one place at a time. The high band arrays at PJ9W were awesome, and would have kicked serious butt from the U.S., but I don't think they had the optimum setup for PJ9. (Also, was it just me, or did everyone think PJ9W was really blowing it on 160 - it didn't seem to me that they had put any work into receiving antennas on that band)

All the credit for the '88 P40V antenna system design goes to Tom, N6BT.

By the way, P40V was single-op this year. Carl no longer has access to the old location, and apparently his new one was tenuous enough that he couldn't make any multiop plans.

This is assuming, of course, that whomever the manufacturer that
is sending you the RS232 signals actually followed the standard.
There seem to be a distressing number of companies that just
omitted the negative going voltage and ran semi-ttl with say
zero v. for mark and +5 to +10 for space. As I tell my class,
your chances of having two devices talk to each other which
are "rs232 standard" are about 50%. RS232 is about the most
non standard "standard" you are ever likely to run into.

I have to admit that things are better now than a few years ago,
since chips like the MAX232 have come onto the scene...

Have you looked at the November 1990 _Popular Electronics_?? There is an article on a 'radfax' decoder that seems to be able to handle radfax, RTTY, and Morse code also. Then again I could be totally wrong because I don't know my head from the proverbial whole in the ground... It seems, however, that (even though the article stresses that you should by some software from Australia) you could at least get some idea's as to how someone else attacked this problem. I seem to recall that they used an IC called a XR2211 FSK demodulator. FSK means Frequency Shift Keying, like the ON/OFF of Morse code, eh? I would suggest taking a look, however, because my neophyte brain is probably mis-interpreting the whole thing...

tima@agora.hf.intel.com

PS: Can I trust Panaxis Productions with a credit card number? I want to buy some 'educational' material along with a subscription to Electronics & Radio Hobbyist's Newsletter. No one seems to be at the other end of the phone, and I'm always a little cautious when it comes to things that are for 'educational' purposes...

2620. Antennas in trees

Newsgroup: rec.ham-radio
Date: 1990-11-01 13:03:06 UTC
From: harrism@dg-rtp.dg.com
Message-ID: <1990Nov1.130306.7640@dg-rtp.dg.com>
Source record: 7117

For you tree climbers out there I found a webbing version
of a tree climber in one of my hunting catalogs. It has a webbing
harness and a webbing climbing loop.

Advantages over rocks, arrows, etc are accurate, exact placement
of antennas, no hangups, no kiddies with arrows in their backs.

Advantages over tree climbing spikes, metal hunting climbing stands,
are cost, and zero tree damage - both very important. An extra climbing
loop allows safe climbing around branches.

Stands and spikes (w harness) can easily run $150 or more. This runs
around $40 to $50 which is in the affordable range. Just what I've
been looking for! (If I could just get the top of that loop up another
30 ft or so...)

If anybody is interested I'll dig up the info on this.

73's,

2621. Identifying mobile antennas

Newsgroup: rec.ham-radio
Date: 1990-11-01 14:35:00 UTC
From: BESSON@VUVAXCOM.BITNET
Message-ID: <9011011437.AA26354@ucsd.edu>
Source record: 7074

I see alot of different short mobile antennas which have a helical section and a straight section. And there seem to be many variations of this design, especially with regard to the total length. Are these all for cellular phones? If not, can one tell from the appearance what bands they are operating in? Some of these have a large base containing (I assume) a loading coil. Can one only guess at what they are running?

Thanks in advance.

Yes.. there are several active groups... first, a magazine
called Electric Radio out of Hesperus Colorado is a really nice magazine
that is focused on 40-50-60s tube equipment, and there are restoration
and upgrade hints, as well as lots of ads for vintage stuff. This
publication is strictly ham-oriented.

also, Antique Radio Classified... which has *lots* of ads, but
is slanted more toward broadcast receivers and "antique" stuff. Both are
very nice, but aimed at different audiences (tho they obviously overlap at
times).

I'll post the addresses for both when I get home tonight.

2626. K1EA CT: using extended memory?

Newsgroup: rec.ham-radio
Date: 1990-11-01 15:56:01 UTC
From: hurta@hcvdl.csc.ti.com
Message-ID: <9011011556.AA26812@tilde>
Source record: 7114

I have a 286 computer with 2 Meg of "extended" (on-the-motherboard) memory. K1EA's CT program uses "expanded" (on-an-external-card-plugged-into-a-slot) memory (when found) to increase the amount of QSO memory available to the program.

I have been using two software "emulators" with great success to create "expanded" from "extended" memory. PC Magazine's EMS40 utility and ABOVE DISC+ have worked successfully with Quattro Pro and Lotus; neither will work with CT. With CT, I get random results (like the logging window goes blank and won't display QSO's for a new log, or if I reload a log with 1 QSO it displays properly until it crashes sometime later, or if I reload a large log CT gives me an out-of-memory error and crashes after about 300 QSO's). :-(

I'm curious if anyone else has tried to use "extended" as "expanded" memory on a 286, and if you got it to work with CT? Or will I need to pull that memory off the motherboard and put it on a cheap EMS card (yuck)? I will be upgrading to a 386 with 4 Meg of on-board memory- will I have a memory problem again?

Thanks, Dwaine

2627. A Proposal

Newsgroup: rec.ham-radio
Date: 1990-11-01 16:32:53 UTC
From: flloyd@sunburn.West.Sun.COM
Message-ID: <1147@west.West.Sun.COM>
Source record: 7078

I would like to propose a new news group:

rec.ham-radio.endless-cw-debate.

I get the impression that there is probably a majority of readers
in rec.ham-radio that feel the same way as I do.

I for one am tired of the endless ranting and raving about this topic
which in all probability does not have an ending. Perhaps we need an
acronym for this topic just like the rec.humor readers made with YALBJ
(Yet Another Light Bulb Joke) - insert YA..CW.. here.

Okay, I could start a Kill file, or just shut up and live with it as
many are already doing. On the other hand, since this is a place for
expressing opinions, then now is just as good a time as any for
me to express mine:

The CW topic is completely worn-out, unresolved and emotionally
charged, much like a religeous debate. Why don't we get back
to the fun part of this newsgroup and just give it a rest?
There must be other more interesting things to discuss around
here. How about it?

To those anti-coders who note that I'm an Extra and would prefer to
flame me by direct e-mail, don't bother, you're wasting your time as
well as mine. I've had the same dumb experiences in getting there as
everyone else. My general views on the subject are liberal and so I
won't bore you with them. My point is that this subject has gone
virtually nowhere in the past several years so why not let it go the
way of the previous rathole discussions like:

Pizza via autopatch
Transmitting out of band (Let's hope it's dead)
etc.

2628. Hammarlund HQ-129-X

Newsgroup: rec.ham-radio
Date: 1990-11-01 16:33:45 UTC
From: kronstad@anaconda.cis.ohio-state.edu
Message-ID: <85508@tut.cis.ohio-state.edu>
Source record: 7115

I appreciate all of the replies I got on asking for the schematics for a HAMMARLUN HQ-129-X receiver. A special thanks to Jim Haynes in Felton, CA for sending me out a copy of the manual so quickly.
I stand (sit actually) corrected about this radio being a transmitter - it is only a receiver. I had assumed since there was a knob on the front saying TRANS/REC that the transmitter was built into the radio - this isn't the case. Anyway, about what year was this radio made? And, I have a terrible audio hum, will replacing the capacitors most likely solve this problem?

"Electrons don't move, they just send PACKETT messages"

>
> The No-Code people are advocating it's elimination from the test, not the
> banning of CW. The Pro-Code people equate non-testing with forbiding it's
> use.

The no-code arguments I usually hear involve the creation of a license
that has no code privileges. This is forbidding the use of code to those
who have a no-code license, just like techs are forbidden to use voice
below 6m. Thus, it is most no-code people who want a prohibition on code.

If the guvviment gives you a code privilege, it should test you on it
to make sure you have rudimentary ability to use it. Just like the
privilege you get to build your own radios has a test to make sure you
have a rudimentary knowledge of how to do it. Or at least how to keep
from burning up a lot of valuable electronic parts in the process.

WARNING WARNING Facetious paragraph follows...

Aha. Many hams don't build their own radios. Let's create a
non-technical license, in the ham bands, for people who buy everything
off the shelf. Allow no technical changes or construction. Just plug it
in and Yak Yak Yak.

END OF FACETIOUS PARAGRAPH.

> If anyone wants to learn it, fine, but I still haven't seen any LOGICAL
> reason for making everyone do it.

1. If the privilege exists, it needs to be tested to some low level so
the learning takes place on a practice oscillator instead of the
airwaves. If you think 5 wpm is slow, what do you think 1 wpm would sound
like?

2. The international treaties governing radio demand it for activity
below 30 MHz. As all current ham licenses have privileges below 30 MHz,
it is required for all current ham licenses.

If you want to create a special no-code license, these reasons are not
relevant. However, as you seem to want just to eliminate it from the test
without prohibiting its use, they are both logical and valid.

FLAME WARNING: this is neither support for, nor argument against, a
NO-CODE license of different privileges than current licenses. It is an
argument for the continuation of CW testing for the current licenses. All
flames, either way, may be sent to /dev/null or NL:.

2630. Will No-Code Save Amateur Radio

Newsgroup: rec.ham-radio
Date: 1990-11-01 16:53:29 UTC
From: enders@plains.NoDak.edu
Message-ID: <6546@plains.NoDak.edu>
Source record: 7118

I think the code/no-code war is a moot point. What we *need* is *much*
greater use of the UHF and microwave allocations. I really don't think
a no-code license is going to make that big a difference. I submit that
the "typical" no-code licensee is going to be more interested in plug-&-play
technology, and having someone else to talk to.

There is precious little equipment available commercially for microwave
(> 1.2 GHz). There are *damn* few people operating > 1.2 GHz, therefore few
folks to talk to (outside of metropolitan areas there is virtually *no one*
to work). I fear that the allocations at 2.3, 3.4, and 5.7 GHz are going to
go away real soon. If we want people to occupy these bands, we need two
things:

1. Commercially available, plug-&-play equipment.

2. A *reason* to operate on these bands.

Sure, microwave experimentation is fine. So is weak signal work. The
sad fact is that this is pretty much all that is going on at 3.4GHz and higher.
Now, a national network of microwave packet switches would help, but this is
most likely not going to be implemented outside of metropolitan areas any time
soon. Geosynchronous orbit satelites would help, but they seem to be a ways
off, too. Digital multi-media communications would help, but again, it ain't
here now.

Where we are now with the microwave bands now is pretty much where we
were in the '20s with 5 meters. Along came full duplex AM phone, and the band
took off like wildfire. We need to spark the imagination of the AVERAGE ham
about our microwave bands. We have to do it now, in 10 years we won't have
to worry about it because they will be GONE!!!

Please keep track of how many courses you are REQUIRED to take there at Stanford (assuming ur a student). In abt 20 years please post to the net how many of those (forced) learned skills you are or are not using. If you find that you are not using most or all of them does it also follow that Stanford as well as all other universities etc. which require certain minimum requirements to obtain a diploma are also "from a utilitarian standpoint" immoral and possibly criminal? [Lots of stuff deleted about CODE-NOCODE, paranioa, knives in hearts, and eating veggies you dont like]

The following is an opinion. Like the law, truths are irrelevant, only perception and sales drive the outcome.

First some facts:

o I am a new ham (only licensed for 5 months)

o I like CW better than all other modes

o On many occasions, I have used other modes. I use packet everyday. I sometimes use RTTY and AMTOR when I want a change.

o SSB is my second favorite of all modes.

o I enjoy DXing and the challenge it presents

o I like contesting too... but need much more practice before I will submit a log.

o I also enjoy a good ragchew.

Now some opinions:

o I think HAM Radio should be made more accessible to the masses. I think radio is viewed as an "archaic" technology by most-- a "solved" problem. Most young people would rather learn to program computers. You can make more money at computers than HAM radio.

o We need more young people in HAM radio.

o We should not allow HAM radio to become undisciplined.

o We should not force people to learn a particular mode to become a HAM.

o We should continue to encourage experimentation and technical excellence in HAM radio.

o We should continue to find ways in HAM radio to allow participants to grow, attain new goals, and make accomplishments. We should be sure that people have something to work for and feel good about when they get it.

o These goals should be difficult, but not out of reach of MOST people -- and relevant to the hobby of HAM radio.

o FINALLY, we should not assume the average HAM is lazy or below
average in intelligence. So we should not make these goals too
easy to attain.

I have heard all of these arguments through reading 9 months of discussion
on the code/no code issue. I believe they all have merit. I do not believe
any one of them precludes or necessitates the inclusion of a CW test to
obtain a license to operate HAM radios.

The one thing I do feel strongly of is that we should find ways to assure
our bands remain disciplined and that we provide goals for our fellow
hobbyists. However, I currently have no data to support the argument that
test format or the CURRENT incentive licensing system achieves those goals.

I do believe incentives are good, though. When you work hard for something
and attain it, you achieve a greater level of self respect, and you are
inclined to be active in protecting the rights you worked for.

>be interested in...

Lava beach, Jerry, I expect. :-) :-)

The claims are a little farfetched, I agree; but not *that* farfetched,
IMHO. Notice he mentioned 4m (!) of space. Heck, that is 0.2 lambda
at 20 meters. Notice that the ad emphasized the size of beams by saying
that they are tens of feet in size and casually saying that you "only"
need 4m of space for the loop. In the same vein, can I claim that a
5/8 wavelength vertical for 20m only takes a square foot of ground?

A vertically-mounted small-loop has the same directivity pattern
as an E-field dipole (honest! only E and H terms are swapped). A 4
element Yagi-Uda has a, what, 8-9 dB gain over a dipole?

Notice that a 4m by 4m loop will have an equivalent small-loop
radiation resistance of damn close to 50 ohms. Granted, at that
size, 31200*(A/lambda^2)^2 (I think that is correct, A = area of
loop) no longer holds; but it is an indication that loss resistance
is now quite well controlled; and thus the loop efficiency can be
quite high.

A 9 dB difference is about 1.5 S-units.

Don't knock small-loops, as long as it is not *too* small :-). The
lambda^4 effect is quite amazing. Using the radiation resistance
equation above, and assuming that it is a square loop that is
m*lambda on a side, we get

m (in wavelengths) radiation resistance
------------------ --------------------
0.05 0.2 ohms
0.1 3 ohms
0.2 50 ohms.

I tend to believe that it is going to be difficult to get a decent efficiency out of the 80cm loop mentioned in the ad. It is a little smaller than .05 lambda at 20m. Interesting that this is about the size of the AEA Isoloop, eh?

I have started to play around with small loops, comparing them against the physically-small helical antennas that I have played with before this. Living in an apartment (flat-dwelling, cliff-dwelling, call it what you want :-) makes experimentation with physically-small antennas a neccessity .... ..

> although you are perfectly free to promote voluntary proficiency in or
> use of CW by anyone who will listen.

WHERE IN THE HECK DID I EVER SAY THESE WERE ARGUMENTS AGAINST THE NO CODE LICENSE??? Someone asked "what was so special about CW" and i answered it. I feel it is special and stated why. I couldn't care less whether there is a no-code or no-exam license unless in imposes on my enjoyment of the hobby.

Why do the no-coders get so paranoid and uptight at the slightest mention of CW?? Its not the "boogie-man" guys.....

Conservative of spectrum would be more accurate. It is efficient
ENOUGH for conversation. I do not think speak or read at 9600 baud
so why should i use more spectrum than is necessary to have a casual
conversation?? Of course my little FM dual-bander sure does sound
nice. Makes autopatching more conveneint :-)

> Moreover, this doesn't demonstrate a requirement for all hams to know or use
> it.
Nobody said it did!! More paranoid whining. All i did was answer a
question and i get accused of "shoving CW down throats". If the no-
coders spent 10% of the time wasted on whining about CW into learning
it, they would all be at 50wpm now.

Lighten up dude...it was a joke :-) The whole thing was not posted
to be refuted. It was a lighthearted answer to a leading question.
> +---------------
> | 5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the
>
> Communicating via QRP SSB is a SKILL and thus rewards the operator with a
> sense of accomplishment and satisfaction.
Where is the skill in talking into a microphone?? We all know that
CW is more of a skill than any voice mode or the code bashers wouldn't
be whining so much about it. :-) (better not forget the smileys this
time or someone may take it serious)
> And please demonstrate that this applies to all hams, and that this is the
> ONLY way to gain a sense of accomplishment and satisfaction.
No. I see no need to bolster an argument i never made.

I sure hope all the future communicator class folks are not this
nit-picky-defensive-condescending-rude on the air.....I prefer
casual friendly conversation. All this whining is tiresome. In the
future, i would hope that the paranoid no-coders would actually READ
a posting before making conclusions as to the poster's political
stance. Show me where in my original posting that i said ONE thing
to deserve all these accusations of "shoving code down throats"??

Many thanks to Tad Cook for providing some sanity to this group.

HELP!!!!!!!! I am looking for a MARS operator that is on
the network. The reason is that I am hoping that I could
send my messages to that person and that later on
they could deliver it. I am trying I guess to be innovative
a little(well maybe not) in doing this. Hopefully this person or
persons will be closer to Saudi Arabia than I am now when I
send a MARS message.

Is there anybody out there?

Thank-You

Dan Gibson

Not really. The point of the argument seemed to be that the
only modes worth considering from the standpoint of a Morse code test
were voice and CW. There are other modes which, taken together, could
rival those modes in popularity. Most of them are available in other
countries and so could be used for international communications.

>that they are glad that they were exposed to CW far outweigh those who think the
>experience was bogus.

So is working with high-speed packet (> 32kbit/sec), yet it isn't required
for a license. It is fun as well. There are sooo many things I enjoy with
ham-radio every day, and after 10 years, I have yet to find the first
opportunity where not knowing morris is a big loss.

Don't force others in your very narrowed view of ham-radio: HR has much more
to offer, and many code-less hams in other countries prove that every day.

>Now here's something you can flame me for...I think the no-code attitude is
>selfish and arrogant. You want to change ham radio in ways that I think will
>destroy it.

How is it that I keep on hearing very worried stories about the average
age of a US ham? How come, that I don't hear similar stories from other
countries?
Other countries which have code-less licenses for may years have proven that
it is a Good Idea. Or at least, it's not as destructive as you say it is.

> You may have the best of intentions, but I don't think you know
>and understand what has kept the hobby alive for the past fifty years. The
>deterioration of good operating procedures we all now hear on the bands is a
>direct result of the loss of the sense of fraternity and tradition that I still
>hear on CW.

The thing that kept the hobby alive wasn't forcing people to learn morse code,
but common interest into playing with radio and meeting friends with similar
interests. Back when everybody made contact using 0V1's, morse was very
important. Right now, there are other possibilities.
Morse is still enjoyable, but so are other modes. Let there be room for all.
Let people find out for themselves if they want to go into the very specific
mode you enjoy working. It is one of the archievements of ham radio that
we now have this choice.

> So what conclusions can I draw? I work VHF,UHF,digital and HF SSB
>and I'm appalled by what I hear. How can I not associate an anti CW thrust with
>a knife in the heart of the Amateur Radio Service? I hope I'm wrong. I hope
>I'm just paranoid. But why do I keep spinning the dial down the bands to talk
>with people who make me feel good about what I'm doing instead of feeling

>profoundly embarrased?

You'll find those people everywhere. In fact, in my neighbourhood, most of the people you described have a code-full license. They started code-less, later added the code test.
On the other hand, most of the people I enjoy working with still have a code-less license. They found other interesting modes and are now occupied and don't want to not have time to learn morse code.
This is a bit extreme, but I hope it convinces that morse code tests and bad manners don't neccessary are coupled.

> AA6PN

[You should check your news software. The return address you give is likely not to work. Shouldn't that be included in the ham radio exams nowadays :-)?]

My General class ticket expired many moons ago (around 1970 or so). I assume that I have to start over and take the code and theory examinations to get my license.
(I think that I can still remember code but probably not at much better than 5wpm). I use to be active on 15 and 20 m but would now like to play around with packet radio. What class of license would make sense (used to be Technician) today and is Kaufman's Q&A still the text to study? I don`t suppose there is anyway way to get one's old call sign back (WB2CLL), is there? I imagine it is in use by some chap. Can one request particular call signs (old or new)? Used to be that Amateur Extra class could get ol

d call signs. Of course, this is more for nostalgia thatn any practical need. Thanks very much.

2642. Packet TCP/IP

Newsgroup: rec.ham-radio

Hi everyone, I'm not sure if this is the place to post this or not, but
it seemed relavant at the time. I recently got involved with TCP/IP on
packet radio. Using a modified version of Phil Karn's Net.exe (G1EMM I
beleive) and I was wondering if there is any type of manual available
for this version. I have the original version that came with NET.EXE
(dated January 1987, I think). This has been very helpful, but there
are a lot of questions that are still unanswered. Any help with this
would be greatly appreciated. Second question concerning TCP/IP: Can
anyone point me in the right direction as to getting an addresss. I
sent Brian Kantor a message but have not heard anything from him.
Is he still in charge of this, and if not, could someone point me in the
right direction? Once again, thanks for any help you can provide me.

}Amateur radio needs explosive growth in the UHF and Microwave spectrum to
}have any hope of holding on to these allocations. Amateur radio needs a
}"critical mass" of operators in the UHF/SHF bands to support real computer
}networking. US society needs more people with an interest in technical career
}fields. Hooking more people on a technical hobby is instrumental in steering
}them to a technical career. Saddling potential recruits with a requirement to
}learn a mechanical skill most of them consider mere hazing is counterproductive
}to these goals.

What makes you think dropping the code requirement will result in
explosive growth in amateur radio? I highly doubt we'll get the
annual growth rate up to even 5-7% with no-code.

Let's face it, ham radio just isn't the cutting-edge hobby it once was,
not with competition from computers, video games, etc. (none of which
require a license of any kind).

Henry Black (G4NOC,KK6JR) inquired;

>Please could you post a brief summary of what this has cost you in
>time and money so far.
>Is there a fighting fund?, is it adequately funded?, am I right in
>thinking you are not using any "special circumstances" to win your case
>and therefore your fight stands to benefit U.S. hams generally?

At last count it was about $6,500 on the day BEFORE the depositions
and that added another $1,500 ++. I still owe some of it but Bob (W2THU,
League consul) has been very gracious about waiting for it. All but a
hundred or so has been out of our pockets (WD8EHL--XYL).

We have been at this for 4 years as of yesterday. Three in federal court.

There are a few volunteer trustees waiting to open the fighting fund
if we don't recover expenses. We hope to find out any day now.
We will let you know via QST and ARRL letter etc.

There are no special circumstances in this case.
The city has an ordinance allowing towers up to
--- SIXTY FEET ---
I checked that out before we bought the place.
What they didn't tell us was that the neighbors
had the last word on the permit.

The permit was denied because;
a) it would impact property values of the entire
community regardless of its height.
(30 ft. at a 29.1 ft. setback)

b) I didn't need it to develop my property.
(Never mind the other dishes, towers
and beam antennas in town - 6 or so , some non-hams)

We do this for all of Ham Radio. All for one and one for all.

It tends to be quite lossy as a counterpoise for verticals.

> I can probably bury a limited amount of wire, but not nearly the length
> required for 20-40m radials.

If you do bury wire, use the insulated type. The idea is to create a
ground image that is not very lossy, not making electrical contact with
the soil.
>
>
> Basically, would I be better off mounting the vertical on the ground rather
> than adding, say, 10-20' of elevation?

You would be best off getting the vertical up in the air, with sloping
radials.
>
> How well will ground mounting work to eliminate the need for radials?

Not very well. But just about anything will "work" as an antenna.

Hey, Gang:

Can we try a "Gedankenexperiment"?

I recently attended a seminar on "Needs Assessment" conducted here at TI by Dr. Allison Rossett (Allison Rossett and Associates, San Diego, California) in which we discussed something she calls "OPTIMALS", the attributes that are desired, or the ideals of what we think should be.

I would like to compile a list of OPTIMALS describing Amateur Radio, and so I turn to you, the net participants for inputs. All you posters and writers and flamers and thinkers and dreamers and even those read this all but never post anything. Please think about this for a moment or two and send me what you think should be on the list.

Use your imagination. Close your eyes, sit back, take a breath, and describe for me the HAM OF THE FUTURE. Forget what the Amateur Radio Service is today. Forget Part 97 as it stands now. Totally ignore the current Question Pool and VE program and Examination Elements.

Don't start with what we have today, but project yourself forward to the end of the Nineties and describe for me the attributes of the (*-IDEAL-*) Ham Of The Future.

What does this person know? What skills and attitudes would such an individual have? Pretend you can, in your dreams, make Amateur Radio in the Twenty First Century what you would like it to be.

How should the public and the government view the Amateur Radio Service? What value does it provide, or in essence, WHY does Amateur Radio exist in the year 2001?

I am not trying to be facetious, and although I don't mind a ":-)" or two, that is NOT what I am looking for, and they will not be included in the database.

I would like to know what folks out there in netland HONESTLY think Amateur Radio (*-SHOULD BE-*). No restrictions based on what is current fact.

Tell me what you want.

Please email directly or post. I might ask for clarification since I am trying to isolate attribute elements, descriptors, and points that (*-can-*) be summarized.

Regards,

Bob West WA8YCD

Congratulations to everybody who had these amazing scores, including N5AU, N2RM, KR0Y, and, of course, K1AR. Jeeze what a score. A tremendous effort by the operators, an excellent station, and maybe the ultimate example of the effect of packet radio on multiop contesting. Do you realize that K1AR, as a multi-single, claimed more countries than W3LPL? !!! (708 I think it was they said on 3830 [in between that guy saying "hey George"])

I was single-op at N4WW, but unfortunately had technical difficulties. Until Saturday night I was putting out maybe 600 watts PEP (I think with lousy audio to boot). Needless to say, I had particular trouble on 160, 80 and 20.

Conditions were so good, though, that I had fun anyway. I managed to climb back up to about 3.5M by the end.

How many of you checked 15 in the middle of the night? Maybe it was only down here in the Southeast, but I found 15 WIDE open to all of europe at 0830Z Saturday morning. I worked about 120 stations before it sort of shut back down. The europeans were pretty suprised to hear me, and I was especially suprised and pleased to be called by VU2GO at 0900. Beat the hell out of looking for South Americans on 75. Last year in the CQWW CW 15 opened to europe after midnight (in fact you could follow their sunrise across UA-SP-DL, etc., but the signals were fairly weak.

I'd call this an open machine with LID filtering. :-)
It doesn't seem practical as a chat machine what with all the individualized codes required to key it. It would be a practical way to control patch access though. As you probably know, I'm not keen on non-emergency autopatch.
I got my new 440 machine on the air from it's final location today. How sweet it is! It's an open machine running 18 watts at 970 feet up a 1040 foot broadcast tower. The view from up there is spectacular.

>below 6m. Thus, it is most no-code people who want a prohibition on code.

Thos who chose the nocode license did so because they didn't want to learn the code (yet) and so are unlikely to want to use it either. But even still it is not necessary to prohibit it altogether. They can still use Morse Code in modes such as CW and modulated audio. It would be bad operating practice for them to jump on the WSDX subbands to learn on.

> If the guvviment gives you a code privilege, it should test you on it
>to make sure you have rudimentary ability to use it. Just like the
>privilege you get to build your own radios has a test to make sure you
>have a rudimentary knowledge of how to do it. Or at least how to keep
>from burning up a lot of valuable electronic parts in the process.

If the guvviment gives you a voice privilege, it should test you on it to make sure you have rudimentary ability to use it.

It might be the current attitute that the theory tests have a basis in preventing the destruction and suffering of innocent electrical parts at the hands of dumb hams, but this is not really the case, and just is not a valid reason for the theory test. I suspect your statement might be made in order to later try to justify the removal of the theory test.

The purpose of a theory test is to make sure you understand how radio itself works. You need to know some things about how radios themselves, particularly transmitters and antennas, work. But you do NOT need to know how to actually build one to be able to use one. So it is not necessary for at least the lesser license (read: it is not necessary to get INTO ham radio) to be able to do this.

And besides, you'd be depriving someone of the pleasures and joy of watching and smelling resistors burn up. :-)

>WARNING WARNING Facetious paragraph follows...

Oh, I thought your PREVIOUS one was facetious.

> Aha. Many hams don't build their own radios. Let's create a
>non-technical license, in the ham bands, for people who buy everything
>off the shelf. Allow no technical changes or construction. Just plug it
>in and Yak Yak Yak.

>END OF FACETIOUS PARAGRAPH.

Glad you acknowledge that the paragraph was facetious. But of course even with a turnkey radio, it is still really necessary to know a lot about the principles of radio to know what is going on. So far I have seen NO RADIO on the market that can prevent RFI, for instance. The operator still has to know what the radio is doing.

>> If anyone wants to learn it, fine, but I still haven't seen any LOGICAL
>> reason for making everyone do it.

> 1. If the privilege exists, it needs to be tested to some low level so
>the learning takes place on a practice oscillator instead of the
>airwaves. If you think 5 wpm is slow, what do you think 1 wpm would sound
>like?

1 WPM? Are you kidding. Don't even suggest learning that way.

> 2. The international treaties governing radio demand it for activity
>below 30 MHz. As all current ham licenses have privileges below 30 MHz,
>it is required for all current ham licenses.

Fine. This is a case for continuing the requirement below 30 MHz, but lots of people don't care about those bands (but they aren't hams yet due to the code requirement).

> If you want to create a special no-code license, these reasons are not
>relevant. However, as you seem to want just to eliminate it from the test
>without prohibiting its use, they are both logical and valid.

No other privileges have specific tests to grant their mere use, so why should code?

Several of the top European minds active in packet radio development entered via their homelands' versions of no-code. I would name names, but I don't remember them. Someone else will no doubt jump in here and fill the gap.

>
>I think you are wrong. The deterioration of good manners among younger people
>is a reflection of society in general that has nothing to do with CW.

Yes Yes Yes....This really is the crux of the whole problem. CW itself does not make for better hams. However, the discipline of learning to operate CW used to require a lot of air time. All of this operating time served to teach new hams proper operating procedures and instill in them a respect for what used to be the fundamental traditions of the Amateur Radio Service: civility,friendlines, patience, and a sense of community dedicated to public service. Today, CW is learned from tapes, computers etc. and very little operating is being done by new hams. What the more traditional (OF) hams are afraid of is the loss of the traditional values. They believe that without the glue of tradition, the Service will collapse into the anarchy of CB. I think this is already happening.
>
>One of the reasons that the operators in the CW subbands are marginally
>more mannerly is that many of them are older and were raised in a more
>mannerly society.

Another three yes's... Most of the hams in the CW bands have spent a long time there learning to operate. The newer hams there seem to be attracted by the the traditional feel of operating there and are willing spend the time and overcome the obstacles necessary be at home there. It's the attraction of being able to go back in time and live in a world that was friendly, mannerly. I have lived in the 40's and 50's and I will tell you outright the life young people today have to look forward to sucks. I feel sorry for them and for myself that I have to watch it happen. Thats why you will find so many traditional hams trying to preserve in ham radio what society today has lost. A decent place to live. And pass it on to young people because they deserve better.

Above 30 Mhz, I agree. Nobody knows what will happen above HF when a no-code licence is implemented. Maybe good things, maybe nothing, and maybe chaos. I hope for the best.

Below 30 Mhz, if the Amateur Radio Service does not reverse the decent into in your face street behavior, commercial interests will have all the ammunition they need to justify seizing all of the ham spectrum as being too valuable to waste on a bunch of radio hoodlums.

Remember: "When they take away your rigs..."
"Only the bootleggers will have rigs."

jerry@altos86.Altos.COM (Jerry Gardner) writes:
>What makes you think dropping the code requirement will result in
>explosive growth in amateur radio? I highly doubt we'll get the
>annual growth rate up to even 5-7% with no-code.

It won't. But what exactly happens will depend on the exact licensing
structure.

What really burns me up, though, is attitudes like "OK, we'll accept a
no-code license as long as it is just an entry point, and there are
incentives to learn CW and upgrade to a REAL license". These people
are going to cause there to be a license class that NO ONE will like.

But back to ham growth:

By itself, a codefree license class is not going to cause people to come
knocking on our door. We have to invite them over first. It will be a
lot easier to promote ham radio once there is a codefree license class
that has enough privileges to be useful.

But we still have to get out there and promote it. We've had MANY MANY
years of code being required for ALL license classes, and as many years
to promote ham radio. Now where are we today? We are losing spectrum
and our kids are playing TMNT video games instead of learning how something
actually works.

By requiring code to get into ham radio, we are depriving our kids of a
opportunity to experience an aspect of technology that will be in high
use in the future.

>Let's face it, ham radio just isn't the cutting-edge hobby it once was,
>not with competition from computers, video games, etc. (none of which
>require a license of any kind).

Are you wanting to just let it go at that and give up on our kids?

2659. licenses

Newsgroup: rec.ham-radio
Date: 1990-11-02 02:19:46 UTC
From: oo7@ut-emx.uucp
Message-ID: <39037@ut-emx.uucp>
Source record: 7110

It's obvious what we should do. Clearly we should get rid of the CW test because it's too hard for some people and many people are sure they will never use it. Same goes for voice and other other modes, building equipment, knowing about propagation, being a VE, operating from space - obviously we have to eliminate all those topics from the ham tests.

Still, some old-fashioned people think we need *something* to make the license worthwile, so I propose three classes as follows:

Novice - knows own name

General - can print own name

Extra - can write own name in joined-up writing

This may be too hard for some, and they may indeed never need to write their own name so perhaps it's too restrictive. Maybe we should just revert to the good old Amurrican system and sell the licenses. More money gets you more privileges, just like the Real World.

The continuation of the CW requirement won't correct a situation that is
just getting worse. Here's ONE observation of why things are pretty bad,
and why a lot of it is on the HF bands. DX used to be a fun challenge.
Today it is no longer so much fun. It appears to be, but the HF bands
are overcrowded (would be nice if they QSY to microwaves) making pileups
the order of the day for every rare DX. Top that off with the fact that
we pretty much know all there is to know about HF propogation and the
challenge is gone.

>Another three yes's... Most of the hams in the CW bands have spent a long time

>today have to look forward to sucks. I feel sorry for them and for myself that
>I have to watch it happen. Thats why you will find so many traditional hams
>trying to preserve in ham radio what society today has lost. A decent place
>to live. And pass it on to young people because they deserve better.

The past is the past. It's nice to go back, but you have to have something
to go back with. But to preserve ham radio you have to deal with the world
as it is today. Maybe you just are not prepared for that.

But preserving a way to dream about the past is not the goal of ham radio.
If you want it to be, petition the FCC to change the Basis and Purpose.

The past is useful for knowledge, but *I* look towards the future. If it
looks bleak I will try to change things so it won't be so bad. But I won't
crawl into a hole and just dream of how it once was.

>Above 30 Mhz, I agree. Nobody knows what will happen above HF when a no-code
>licence is implemented. Maybe good things, maybe nothing, and maybe chaos. I
>hope for the best.

I at least did a bit more than hope by filing comments to suggest ways to
make sure of the success.

Source record: 7112

It may be still a few more months before the FCC makes a decision on 90-55, the Communicator/No-Code issue. Between now and then, I'd like to see some hams do something worthwhile to help correct the problems. Specifically I suggest that each and every one of you, whose PRIMARY bands of usage (however you want to quantify "primary") is HF, take it upon themselves to actively promote the UHF and SHF bands to other hams whose PRIMARY band of is HF.

Set as your goal to convert ONE HF'er per month to be a ham whose PRIMARY band of usage is 220, UHF, or SHF. Upon conversion of 10 such hams, maybe we can award you with an "Honorary UHF'er" award.

You will be doing all of Amateur Radio a big favor in TWO ways.

1. You will be helping to increase the (badly needed) usage patterns of the UHF and SHF bands.

2. You will be helping to relieve the overcrowding situation on the HF bands.

If hams had been doing this for the past 10 years, there probably would not have been this silly code debate.

Right. There is a 1-year grace period after your license expires, I believe.

>(I think that I can still remember code but probably not at much better than
>5wpm). I use to be active on 15 and 20 m but would now like to play around
>with packet radio. What class of license would make sense (used to be
>Technician) today and is Kaufman's Q&A still the text to study?

Technician or higher would be fine for VHF packet radio. You'd want at least
a General if you want to also do much HF work. I don't think Kaufman's Q&A
is still around now that commercial licenses are defunct. The ARRL ones are
good. They now have a different book for each license class.

>I don`t
>suppose there is anyway way to get one's old call sign back (WB2CLL), is
>there? I imagine it is in use by some chap. Can one request particular call
>signs (old or new)? Used to be that Amateur Extra class could get old
>call signs. Of course, this is more for nostalgia thatn any practical need.
>Thanks very much.

You can no longer request a specific callsign for any reason, as I understand
it. You can request a new callsign when you upgrade (the higher the license,
the shorter the callsign), but callsigns are issued at random.

Don't let this get around :-), but I also used CT in the contest and liked
it a lot.

So when is someone going to write a similar program for the Macintosh?
Or is one of the currently available programs just as good? I haven't
seen any of the contesting programs (such as ZCo's "Six Shooter") myself.

Different world isn't it, only 600W PEP indeed !
400W PEP is our limit, very much less on 160M.
I wonder how the top (legal) UK score compares with the K1AR score.
Does the 1.5 Kw power input make that much difference ? Or are the big
guns just 20 over 9 instead of 10 over 9 ? I would have thought that
the receiver and location was much more important. Any statistics anyone ?

Message-ID: <410001@hpqmole.sqf.hp.com>
Source record: 7123

2nd ever attempt at posting - anything could happen - apologies in advance!

My UK licence spells out very clearly that certain HF bands are shared
and that we use them only on a secondary basis. Some of the primary users
are shore stations and some were/are only equipped to transmit CW. These
users have the right to ask amateurs to close down. If the rule-makers
were not satisfied that amateurs could be relied upon to understand a
request to QRT in CW at a speed that a commercial op could go down to, then
we probably would have fewer HF/MF bands. It is likely that CW was seen as
a sort of simplest common denominator with (at that time) the best chance
of getting through so even phone and RTTY stations might have to resort
to it !

As RF tends to be rather non-patriotic regarding immigration control,even
countries without secondary-status amateur bands have a CW requirement to
help those who do.
I believe that there is an international agreement insistint on proof of
CW ability (no particular speed, though) for access to <30MHz amateur bands.
Marine radio is dropping the use of CW, and is also using satellites
increasingly. It is possible that if the legislators can agree, and that
if secondary user bands remain then some "universal" mode to substitute for
CW can be agreed upon, then CW can become an optional skill

I think that it is fair to say that the CW requirement was a reasonable
thing when it was imposed, and the reasons (as seen by legislators) are
only just now going away, but no-code licences will be possible.

The UK does not have incentive licencing , so we probably have a
different viewpoint to those of you in the US, But we do have no-code
amateurs on all >30 MHz bands, all modes, full power. This enables one with
no interest in HF to choose to ignore CW. To go on HF requires a CW test pass
to comply with, I believe, internationally agreed requirements. Many of
our no-code people are good operators although some are bad. Of those who
passed the CW test, exactly the same can be said.

I find CW fun

I hope people will voluntarily try it

I hope they enjoy it

I just dont see any advantage to amateur radio in forcing it down other
people's throats.

I think that it is ill-mannered to try to FORCE your values on others

I think I'd better find a flame-proof suit

73

A while back I posted to this news group and recieved good results. However, I still have not found a morse code trainer. I have recieved from some hams at Sun a wonderful morse generating program. Type what you want to hear and end with a carriage return. It is called 'send'. The tones that are produced are pleasing to the ear. However, this is NOT a morse trainer. Does anybody have some C source code for a morse trainer? Especially one that could be grafted together with 'send'. BTW, 'send' supports the farnsworth method :-) Also, 'send' is for /dev/audio on the sparc1+, so keep that in mind if think you would want it for your machine.

PROPAGATION FORECAST BULLETIN 44 ARLP044
FROM ED TILTON, W1HDQ
SPRING HILL FL OCTOBER 29, 1990
TO ALL RADIO AMATEURS

EARLY IN THE SECOND HALF OF OCTOBER THE SOLAR FLUX DROPPED RAPIDLY. IT HAD PEAKED AT 232 ON THE 15TH, THE HIGHEST FLUX READING SINCE LATE IN AUGUST, BUT BY THE 20TH IT WAS DOWN TO THE 150S. A LOW OF 152 CAME ON THE 28TH.

A CLEAR SKY ON THE 29TH SHOWED NEW SPOT ACTIVITY ON THE SUN NEAR THE EAST LIMB, AND THE SOLAR FLUX BEGAN TO RISE. DISTRIBUTION OF ACTIVITY ON THE SUN IS SUCH THAT HIGHER FLUX NUMBERS MAY CONTINUE FOR SEVERAL DAYS. NONE OF THE SPOTS PRESENTLY VISIBLE WILL BE LOST TO SOLAR ROTATION FOR SEVERAL DAYS, SO THE FORECAST WEEK MAY PROVIDE HIGHER USABLE FREQUENCIES INTO EARLY NOVEMBER.

WHATEVER THE SUN DOES, NOVEMBER OFTEN PROVIDES HIGH USABLE FREQUENCIES AND GENERALLY GOOD PROPAGATIOC BOTH PEAKING LATE IN THE MONTH. WITH INTEREST IN 50 MHZ DX NOW WORLDWIDE, THIS COULD BE ONE OF THE MOST INTERESTING MONTHS FOR VHF DX ON RECORD. TEN METERS AND THE MEW BANDS WILL ALSO BE AT THEIR BEST.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 18 THROUGH 24 WERE 166, 142, 129, 143, 132, 133 AND 126 REEPECTIVELY, WITH A MEAN FIGURE OF 138.7. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 195, 221, 200, 187, 169, 164 AND 157, WITH A MEAN FIGURE OF 184.7.

DX BULLETIN 44 ARLD044
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN, N2KW AND THE TRISTATE DX PACKETCLUSTER NETWORK FOR THE FOLLOWING DX INFORMATION.

ANGOLA, D2. RUMORS PERSIST OF A WEEK OF OPERATION ON SSB, CW AND RTTY FROM LUNDA BY A WELL KNOWN EUROPEAN DXER.

ALBANIA, ZA. IN A REVERSAL OF WHAT WAS WIDELY EXPECTED, A TRIO OF ALBANIAN OFFICIALS VISITED BUDAPEST RECENTLY, FOR A DEMONSTRATION OF AMATEUR RADIO.

BAHAMAS, C6. C6AFQ BY K1TN AND KR1S WILL ENTER THE CQWW CW CONTEST, WITH OPERATION ON THE NEW BANDS OUTSIDE THE CONTEST NOVEMBER 21 TO 27. QSL C6AFQ TO K1TN AND C6A/KR1S TO KR1S.

BANABA, T33. KIYOKO, ZK3KY, WILL BE JOINING THE BANABA TEAM DURING THE T33R OPERATIONS SCHEDULED FOR NOVEMBER 6 TO 20. WATCH FOR T33R ON 1823, 3785, 7085, 14145, 14185, 21285 AND 28485 KHZ SSB. THE CW STATION T33T, WILL BE ON 1832, 3505/3523, 7003/7023, 14023, 21023 AND 28023 KHZ. 12, 17 AND 30 METER ACTIVITY DURING THE SECOND WEEK OF OPERATION. QSL VIA OH3GZ.

BRUNEI, V85. LOOK FOR V85OO BY N2OO NOVEMBER 12 TO 16. OPERATION WILL BE ON 80 THROUGH 10 METERS AND WILL BE MOSTLY CW.

EASTERN MALAYSIA, 9M8. 9M8MKS WILL BE ACTIVE NOVEMBER 10 TO 12 FROM THE SEANET CONVENTION. THE CLUB STATION IS LOCATED AT THE HOLIDAY INN KUCHING, SARAWAK. QSL VIA 9M2FH.

JUAN FERNANDEZ, CE0. WATCH FOR CE0ZZZ NOVEMBER 10 TO 18. CW, SSB AND RTTY ON 80 THROUTH 6 METERS PLUS AO13. QSL VIA CE3BFZ. CE0ZCD HAS BEEN WORKED ON 14195 KHZ AT 0100 UTC AND 28510 KHZ AT 1300 UTC. ALTHOUGH LOCATED ON JUAN FERNANDEZ, SERGIO QSLS VIA BOX 1972, VALPARAISO. CE0ZIG IS LOCATED ON EASTER ISLAND.

MALPELO, HK0. HK0TU IS DUE TO OPEN TODAY FOR A 5 DAY OPERATION. FREQUENCIES WILL BE 1825, 3505, 7005, 14025, 21025 AND 28025 KHZ FOR CW. FOR SSB, LOOK ON 1835, 3795, 7085, 14145, 21195 AND 28395 KHZ. QSL VIA HK3DDD.

MINAMI TORISHIMA, JD1. JH1MAO/JD1 HAS BEEN ACTIVE THIS WEEK. QSL VIA JA1GUC. JR1VTDT/JD1 HAS ANNOUNCED A 2 WEEK OPERATION FROM MARCUS ISLAND AS WELL. IT IS NOT KNOWN IF THESE TWO ARE TRAVELING TOGETHER OR NOT.

MONGOLIA, JT1. JT1CO MEETS KA2BBZ ON THURSDAY AT 0000 UTC ON 21285 KHZ. BILL WILL ATTEMPT TO ARRANGE A 10 METER SCHEDULE FOR THE DIFFICULT PATH TO THE EAST COAST OF THE USA.

MOZAMBIQUE, C9. ONLY A FEW DAYS REMAIN TO WORK C9QL. IRIS WAS ON 40 METER CW MONDAY, ADDING ANOTHER BAND TO THIS MOST WELCOME STOP IN THE YASME ITINERARY.

ROTUMA, 3D2. FAMILIARIZE YOURSELF WITH THE OPERATING HABITS OF A35XV. IN ANOTHER WEEK, OR SO, BING WILL BE SIGNING 3D2XV FROM ROTUMA.

TONGA, A35. A35XV, BY VK2BCH, HAS BEEN ACTIVE ON 40 THROUGH 10 METER SSB. BING IS SCHEDULED TO MOVE ON TO ROTUMA IN A WEEK OR SO. TRY 14222 KHZ AT 0400 UTC.

SAUDI ARABIA, HZ. 7Z1AB IS THE NEW CLUB STATION AT THE AMERICAN EMBASSY COMPOUND IN RIYADH. RICK IS TRYING TO BUILD THE STATION UP IN BETWEEN HIS 18 HOUR WORKDAYS. HE TRIES TO GET ON THE AIR BETWEEN 1700 TO 2000 UTC, EITHER 15 METER SSB OR ON VARIOUS 20 METER NETS. OPERATORS DON, DAN AND DIRK HAVE EVEN LESS TIME AVAILABLE TO OPERATE. DON LIKES CW. THERE IS A PLAN AFOOT TO PUT THE IC 765 ON RTTY IN THE NEAR FUTURE.

SUDAN, ST2. WZ26C/ST4 IS QRT. ERIC HAS COMPLETED HIS PROJECT IN THE SUDAN. HE IS CURRENTLY IN KENYA, AWAITING TRAVEL ARRANGEMENTS TO ENGLAND. HE ASKED US TO PASS ALONG HIS THANKS FOR THE OUTSTANDING COOPERATION OF ALL RADIO AMATEURS AND THEIR UNDERSTANDING HIS OPERATING RESTRICTIONS. QSL VIA W4FRU.

TURKEY, TA. TA0W IS LA6WAE WHO SAYS TO QSL VIA LA5NM.

WEST KIRIBATI, T30. TARAWA IS THE SITE OF AN IMPROMPTU DX CONVENTION. T30JH BY VK2GJH IS STILL ACTIVE. WITH JG2BRI, OH1RY, SM7PKK, TF3CW, AND ZK3KY ALL IN TOWN, STAGING FOR THEIR BANABA ADVENTURE, IT SHOULD BE EASIER TO CATCH T30, THIS WEEKEND, THAN ANY TIME IN RECENT MEMORY.

>Jersey ?

This is one of those grey areas, but first let me answer the simpler question: Where do hams stand with the law in NJ? - The current law is over 50 years old and does NOT have any exemption for hams. That is why the ham community along with swlers, etc have been pushing for a change.

As to the 2 meter rig in question. It would likely come down to individual interpretation by the police, presuming the cop that might have stopped you (presumably for some other reason than having the radio in the first place) even can determine the ham rig has an extended receive capability beyond that of the ham band.

As to the rig being in violation, according to attorney Frank Taranella (a ham himself) the rig is a technical violation of the existing law, since the extended coverage (138 to 144 Mhz and 144 to 174 Mhz) does have government channels in it. What might happen if one is stopped is, as mentioned already, subject to the whims of the law enforcement community. Once again, the problem as I see it is: Why should we (hams) even hhave to be in a position to worry about this sort of thing in the first place?

All hams, swlers, etc should support the passage of NJ Assembly bill #A-3044 which would lift the current restrictions for everyone.

/[...] I propose three classes as follows:
>
>Novice - knows own name
>
>General - can print own name
>
>Extra - can write own name in joined-up writing

The tragedy is that the theory tests are actually at about this level.

I guarantee that if any person of average intelligence & memory spends maybe 1 hour/day for a month, they could pass the extra test. There just aren't that many questions. You could do it just by memorisation. Afterwards, you will still know nothing about radio, but you will have all the theory for a licence.

The pro-coders say the code keeps out the 'riff-raff'.
The no-coders say the code keeps out people who would be good hams.

They are probably both right. If we had stiffer theory tests, we wouldn't have to rely on cw as the only barrier keeping the 'unwashed hordes of CBers' off our bands.

I defy anyone to claim that ANY of the theory tests ensure that the new ham will know enough to build or perform significant modification on a transmitter. Yet this is precisely what separates the Amateur service from all other radio services. The reason most hams turn into appliance operators is that they don't know enough to be anything else.

The sooner we stop arguing about the no-code license and start worrying about the current no-theory license, the sooner we will be able to take ham radio into the 21st century.

Well, I saw the Kenwood TH-77A adds in QST and CQ last week, so I called up AES and asked what the scoop was on availability. They said that no one in the US had any stock, but offered to take my order and visa card number. Since the Kenwood rep at Pacificon told me three weeks ago that it would be 3-4 *months* before we saw it, I figured the AES order might come through by Xmas. Surprised me, I got had it on the doorstep when I got home yesterday. (This doesn't say much for the Kenwood rep's repuation.)

I haven't had enough time to really play with it yet. However, I've got some cursory comments:

-it is cute
-it is the same size as the TH-26
-lot's of tiny buttons and I've got large fingers
-PL encoder is already in the unit
-the worst manual I've seen out of Kenwood, they must have rushed it, there are lot's of features but not one clear explanation of what what they really are.
-the 2m receiver seems to pickup a more noise (e.g., cross-modulation and/or computer harmonics) than the TH-26. First impression.
-the main and sub channels have their own volume controls, however the UHF and VHF have fixed squelch controls. The VHF is located under the SUB volume knob, the UHF under the MAIN volume knob.
-keyboard toggle-able transmit lock (I'm glad to see this back)
-push on, push off power switch located above the MONI switch
-keyboard selectable transmit power levels
-DTMF keyboard buttons light in addition to the display
-microphone and 13.8 VDC in are on the top of the radio
-the function id's on the display are *very* tiny and hard to read
-the SHIFT (+/-/s) button is a one-push, the REV button is the function shift of the SHIFT button. Personally, I need the REV button a lot more than I need the SHIFT button and wished they would have done it the other way around.
-They ship a PB-10 with the TH-26, the TH-77 manual describes the PB-10 charging, but they shipped a PB-6 with its different charger with the new radio. The PB-10 can only be charged from a wall charger, the PB-6 has a special charger head that fits over the battery, in addition it also drops into the BC-10/11.

Well, that's about all I've had time to disgest. I've got to go through the manual and try to translate it out into some operational sense.

The difference between 400 W and 1500 W is less than 6 dB, less than one S-unit. If it weren't for the fact the so many stations in this part of the world run 1500 W, I expect the contest scores would be just as high with 400 W. After all, the vast, vast majority of the stations worked by the winners are running low power and, as the old saying goes, "You can't work 'em if you can't hear 'em." In addition, especially in the SSB contest, the bands are so crowded that only the loudest stations can stake out a frequency successfully. The stations with the big scores have to spend most of their time calling CQ and running other stations, since it's the only way to keep up the kind of rate necessary to compete.

Well, actually, you do speak at 9600 bps, or somewheres thereabouts. SSB is suprisingly close to the Shannon bound, with ACSB being even closer. Somehow, CW always seemed too slow for me. And, given the symbol time and channel fading, it lacks the redundancy of voice. But, I've made these points before...

> Where is the skill in talking into a microphone?? We all know that
> CW is more of a skill than any voice mode or the code bashers wouldn't
> be whining so much about it. :-)

Wrong end. As with any communication system, the hard part is the receiver. A well trained, experienced weak signal sideband op can pull all kinds of signals out of the ether that your average human wouldn't. That's because the human auditory system is optimized for speech.

Amen! The ARRL currently goes through a lot of gyrations and expense to
administer the Code Proficiency, WAS, DXCC, and other awards with
questionable public benefit. What if the ARRL provided proficiency
awards in technical knowledge? Just as Joe Ham could get a certificate
for copying code at 40wpm (an admirable goal, don't get me wrong!) he
could also get a nice piece of wallpaper for studying the fundamentals
of TCP/IP or Microwave Communication, or other subjects. If it was all
accredited by some suitable acrediting board, Joe Ham could even get
college credit and financial aid! NARTE (National Association of Radio
and Television Engineers) already provides some form of
cross-accredidation for holders of Amateur Advanced and Extra licenses,
think of what could be done with this proposed self-betterment program!

Maybe then the ARRL could put some substance behind its espousing of ham
radio as a "trained bank of electronics experts" that it keeps handing
out to the FCC, the Congress, and the ARRL Membership.

(Yes, I'm a a member, and I make my opinions VERY clear to my SM and my
Division Director.)

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF OHIO

EASTERN DIVISION

JAMES D. MacMILLAN,) 1:87,CV 2820
)
Plaintiff,)
)
- vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,)
)
Defendants.)

Battisti, J.

Before the court is Defendants' Motion to Dismiss and/ or for Summary Judgment. Also before the court is Plaintiff's Motion for Partial Summary Judgment on Counts I and III of his Complaint.

Plaintiff James D. MacMillan ("MacMillan"), an amateur radio operator, licensed by the Federal Communication Commission, brings this action against the City of Rocky River, the Building Commissioner for the City of Rocky River ("Commissioner"), in his individual and official capacities, and the members of the Board or Zoning and Building Appeals of the City of Rocky River ("Board"), individually and in their official capacities, for denying, pursuant to certain City ordinances, his application to construct a thirty foot radio antenna system at his Rocky River residence. MacMillan seeks a declaratory judgment, injunctive relief and damages, based upon alleged violations of his rights under the United

1

States Constitution and relevant federal statutory law (1) Jurisdiction in the federal district court is predicated upon these alleged violations of the United States Constitution and federal statutory law. 28 U.S.C. (sect.)(sect.) 1331, 1337 and 1343 (1982).

I. FACTS

On or about January 20, 1987, Plaintiff applied to the City of Rocky River for a building permit to construct a thirty (30) foot antenna system at his residence on Gibson Drive in Rocky River. On June 5, 1987, the Commissioner notified the Plaintiff in writing that his application for a building permit was denied based upon three grounds. First, the Plaintiff's proposed radio tower would exceed the maximum

height allowance under section 1143.10(b) of the Codified

Ordinances of the City of Rocky River. Section 1143.10(b)

states in relevant part that:

"broadcasting towers, radio... antennae... may
be erected above the height limit for the district,
subject to the following constraints:

(1) The height from the base of such
structure, or the uppermost point at which such
structure is attached to a building, to the top
of such structure shall not be greater than the
horizontal distance from the base of the
structure to the nearest adjoining property

---

(1)Specifically, as an amateur radio operator, Plaintiff claims violations of his rights under the Communications Act of 1934, 47 U.S.C. (sect.) 151, et seq., and the rules and regulations of the Federal Communications Commission ("FCC") promulgated thereunder, 47 C.F.R. , Part 97.

line.

Codified Ordinances of the City of Rocky River (sect.)
1143.10 (Ord. 59-73, Passed July 23, 1973) (1985).

In addition, the Commissioner stated that Plaintiff failed to

provide certain technical information necessary to reviewing

the permit application. Finally, the Commissioner stated that

the proposed radio tower was not necessary for the development

of Plaintiff's property and would result in a substantial

impairment of neighboring real estate values, thus justifying

denial of the permit pursuant to section 1333.02 of the

Codified Ordinance of the City of Rocky River. Section

1333.02 states that:

Whenever application is made for a permit to
construct or alter a building or structure within
this City, and the Building Commissioner finds that
the proposed building or structure is of such value,
design, material or location that it will result in
a substantial impairment or destruction of value in
neighboring real estate, and if he further finds
that the use of the particular design, material or

location proposed, or substantially similar ones, is not reasonably essential to the development of the property proposed to be built or altered, the Building Commissioner shall refuse to issue the permit. He shall within five days notify the applicant of such refusal and the reason thereof.

Codified Ordinances of the City of Rocky River (sect.)1333.02 (Ord. 3077, passed November 14, 1955) (1985).

Plaintiff appealed this determination to the Board. On or about August 13, 1987, the Board approved the Commissioner's decision to refuse Plaintiff's application for a building permit.

3

On or about August 27, 1987 Plaintiff appealed the Board's decision to the Cuyahoga County Court of Common Pleas, pursuant to Ohio Rev. Code Ann. (sect.) 2506.01 (Anderson 1981 & Supp. 1989).(2) See James D. Macmillan, et al. v. the City of Rocky River, Ohio, et al. , Case No. 135089. On or about October 6, 1987, Plaintiff filed a Motion for Enlargement of Time with the Cuyahoga County Court of Common Pleas, requesting an extension until October 27, 1987, to file a Brief in Support of his Appeal. On or about October 27, 1987, Plaintiff filed a Motion to Stay Proceedings in that Appeal. On November 9, 1987, Defendants filed a Brief in Opposition to Plaintiff's Motion to Stay Proceedings in the Court of Common Pleas. Apparently, Plaintiff has, to date, filed no brief in support of his appeal in the court of common pleas. On October 27, 1987, the same day Plaintiff filed his motion to stay proceedings in the court of common pleas, Plaintiff also filed the complaint in the instant case in federal court.

The complaint alleges six claims against the City, the

Commissioner and the Board:

---
(2) (sect.) 2506.01 states that:

Every... decision of any... board... or any
political subdivision of the state may be reviewed by the
common pleas court of the county in which the principal
office of the political subdivision is located...

4

Count I --- Sections 1331.01, 1333.02, and 1143.11(b) of

the City Ordinances contravene federal law on their face and

as applied to Plaintiff, thereby violating Art. VI (sect.) 2 of the

United States Constitution.

Count II --- Sections 1331.01, 1333.02, and 1143.11(b)

are unconstitutional on their face and as applied, in that

they unreasonably burden radio communications and interstate

commerce, thereby violating Art. I (sect.) 8.

Count III --- sections 1331.01, 1333.02, and 1143.11(b)

are impermissibly vague and overbroad, thereby violating the

First and Fourteenth Amendments. In addition, Defendants

failure to promulgate reasonable rules relating to the grant

of permits deprives Plaintiff of equal protection and due

process, in violation of the Fourteenth Amendment.

Count IV --- Sections 1331.01, 1333.02, and 1143.11(b)

are void and unconstitutional on their face and as applied

insofar as they constitute an invalid exercise of state police

power.

Count V --- sections 1331.01, 1333.02, and 1143.11(b) are

void and unconstitutional on their face and as applied in that

they deprive Plaintiff of equal protection in the exercise of

his constitutional rights, guaranteed by the Fourteenth

Amendment.

Count VI --- Defendant commissioner and Board members

conspired to and did, under color of State law, deny plaintiff his constitutional right to a fair hearing and of his rights

5

and privileges under the First and Fourteenth Amendments and by statute.

Plaintiff seeks declaratory and injunctive relief, as well as damages. The suit names as defendants the City of Rocky River, the Commissioner in his official and individual capacity, and the Board members in their official and individual capacities.

Defendants argue that the court should invoke the doctrine of abstention and decline to exercise jurisdiction. Alternatively, Defendants argue that Plaintiff's complaint should be dismissed in its entirety for failure to state a claim upon which relief can be granted, and/ or Defendants should be awarded summary judgement as a matter of law. Defendants also argue that the Commissioner and the Board members are protected from civil liability by qualified immunity, and therefore, the complaint against them in their individual capacity should be dismissed. Finally, Defendants argue that the Board members are not proper parties to the lawsuit, and thus, the court should dismiss all claims alleged against the members of the Board in their official capacity.

Plaintiff has moved for partial summary judgement on counts I and III.

II. ABSTENTION

The court finds no reason to abstain in the instant case. Noting that "[a]bstention from the exercise of federal

6

jurisdiction is the exception, not the rule," Colorado River Water Conservation Dist. v. United States, 424 U.S. 800, 813

(1976) and that absent "exceptional circumstances," County of Alleqheny v. Frank Mashuda Co. , 360 U.S. 185, 189 (1959), federal courts have "the virtually unflagging obligation.. . to exercise the jurisdiction given them, " Colorado River, 424 U.S. at 817, the Supreme Court has confined the circumstances appropriate for abstention to three general categories: (1) those that present "a federal constitutional issue which might be mooted or presented in a different posture by a state court determination of pertinent state law" ("Pullman" abstention) ; (2) those that present "difficult questions of state law bearing on policy problems of substantial public import whose importance transcends the result in the case then at bar" ("Burford" abstention) ; and, (3) those in which "absent bad faith, harassment, or patently invalid state statute, federal jurisdiction has been invoked for the purpose of restraining state criminal proceedings" ("Younqer" abstention). Colorado River, 424 U.S. at 815-816. Defendants' brief argues that this court should abstain from ruling on Plaintiff's constitutional allegations under the Pullman line of cases. This argument, however, demonstrates a misunderstanding of the nature of that doctrine. Defendants claim that this court should withhold judgement until the Ohio courts have an opportunity to rule on the preemptive effect of the Federal Communications

7

Commission's Memorandum Opinion and Order In the Matter of Federal Preemption of State and Local Regulations Pertaining to Amateur Radio Facilities, 50 Fed. Reg. 38813 (adopted September 16, 1985) (hereinafter referred to as "PRB-l"). While the preemptive effect of PRB-l will be discussed herein, it is enough to note at this time that preemption is

not an unresolved question of state law of the type envisioned in the Pullman line of cases. Preemptive effect is, instead, a question of federal law, and thus, not a proper ground for Pullman abstention.

In addition, a federal court should only abstain under the Pullman doctrine where the state statute in question is uncertain. Babbitt v. United Farm Workers National Union, 442 U.S. 289, 306 (1979). In this instance, defendant has failed to indicate any way in which the relevant ordinances could be interpreted by Ohio state courts to avoid the constitutional questions raised in this action.

Burford abstention is also inappropriate in this case, as the state interest in local land use policy is insufficient to overcome the strong federal interest in promoting amateur radio operations. The Supreme Court stated in the Colorado river case that "the presence of a federal basis for jurisdiction may raise the level of justification needed for abstention." 424 U.S. at 815 n.2l. In issuing PRB-l, the FCC created "a limited preemption of state and local regulations which preclude amateur communications." 50

8

F.Reg. 38813. PRB-l states that:

> The ruling is necessary so that amateurs and local governing bodies alike will be aware of the strong federal interest in promoting amateur communication. The effect of the ruling is to give local communities and amateur operators a clear statement of the federal interest in amateur communications.

Id. (emphasis added).

In addition, the ruling states that local ordinances "must be crafted to accommodate reasonably amateur communications" and to "represent the minimum practicable regulation to accomplish the local authority's legitimate purpose. " Id. at 38816.

In light of this clear federal interest and the presence of at least partial preemption of local ordinances, it would be inappropriate for this court to abstain.

Several other federal courts have refused to abstain in cases similar to the one at hand. In Izzo v. Borough of River Edge, 843 F.2d 765 (3rd Cir. 1988), the plaintiff, an amateur radio operator licensed by the FCC, applied to the borough planning board for a variance to construct a forty foot transmission tower at his residence. After a hearing, the board denied the variance, and the applicant filed a complaint in district court alleging constitutional violations and an invalid exercise of the borough's police power. The court stated that while " [f]ederal courts have expressly disavowed any desire to sit as a statewide board of zoning appeals hearing challenges to actions of municipalities.. ., [t]he special circumstances here require that the district

9

court retain jurisdiction and adjudicate its dispute." Id. at 769. Among those "special circumstances" was that "an express, narrow, and quite specific federal provision threatens, at most, only a minimal disruption of a broad state policy." Id. See also Bodony v. Incorporated Village of Sands Point, 681 F.Supp. 1009, 1014 (E.D.N.Y. 1987) (finding abstention in such cases "inappropriate").

Accordingly, abstention is not warranted in the instant case.

III. STANDARD OF REVIEW

Defendants argue that this action should be dismissed pursuant to Fed. R. Civ. Proc. l2(b) (6) for failure to state a claim upon which relief can be granted or alternatively that summary judgment should be granted. The court will treat

Defendant's motion as one for summary judgment, as matters outside the pleadings are presented to and not excluded by the court. Fed. R. Civ. P. 12 (b). The granting of summary judgment is proper "if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c) ; see Celotex Corp. v. Catrett, 477 U.S. 317 (1986). In considering the propriety of a motion for summary judgment, the court must view all facts and inferences in a light most favorable to the

10

nonmoving party. Securities and Exchange Commission v. Blavin, 760 F.2d 706, 710 (6th Cir. 1985).

"The moving party has the burden of showing the absence of genuine disputes over facts which, under the substantive law governing the issue, might affect the outcome of the action." Harris v. Adams, 873 F.2d 929, 931 (6th Cir. 1989) (citing Anderson v. Liberty Lobby, Inc. ., 477 U.S. 242 (1986)). The nonmoving party, on the other hand, "is required to present some significant probative evidence which makes it necessary to resolve the parties' differing versions of the dispute at trial." 60 Ivy Street Corp. v. Alexander, 822 F.2d 1432, 1435 (6th Cir. 1987) (citing First Nat'l Bank of Arizona v. Cities Serv. Co., 391 U.S. 253, 288-89 (1968)). The nonmoving party must go beyond the pleadings "and by her own affidavits, or by the depositions, answers to interrogatories, and admissions on file, ' designate specific fact showing that there is a genuine issue for trial." Celotex Corp. , 477 U.S. at 324.

III. PRECLUSION

Plaintiff seeks summary judgement in this case on the ground that the local ordinances in question, both as written and applied, are preempted by PRB-1, and thus, may not be enforced without violating the Supremacy Clause of Article IV, section 2 of the United States Constitution. "Federal preemption is premised on the Supremacy Clause and

11

manifestation of Congressional intent to exclude state law." Bulchis v. City of Edmonds, 671 F. Supp. 1270, 1273 (W.D. Wash 1987) (citing Chicago & North Western Transportation Co. v. Kalo Brick & Tile Co., 450 U.S. 311, 317 (1981)). As "[f]ederal regulations have no less preemptive effect than federal statutes, " Fidelity Fed. Sav. & Loan Ass'n v. De La Cuesta, 458 U.S. 141, 153 (1982), the FCC has the power to preempt local ordinances which conflict with federal policies. The FCC issued PRB-1 pursuant to its power to "make such rules and regulations, and issue such orders, not inconsistent with this chapter, as may be necessary in the execution of its functions. " 47 U.S.C. (sect.) 154(i).

It must be noted initially that this court need not even consider the possible preemption of (sect.) 1143.11(b), as it is the court's opinion that there is no violation of that ordinance as drafted. Where a "state's highest court has not spoken to the question in controversy, the federal court must discern how the state courts would respond if confronted with the question. " Hartford Fire Ins. Co. v. Lawrence, Dykes, Goodenberger, Bower & Clancy, 740 F.2d 1362, 1365 (6th Cir. 1984). Neither party has identified any instance in which the Supreme Court of Ohio has had the opportunity to interpret (sect.) 1143.11(b). Certainly, defendant has shown no state court support for the Commissioner's interpretation of the

ordinance. See Deposition of Kevin Beirne, at 78-83. "Under Ohio law, " [i]t is a cardinal rule that a court must first

12

look to the language of the statute itself to determine the legislative intent. ... If that inquiry reveals that the statute conveys a meaning which is clear, unequivocal and definite, at that point the interpretive effort is at an end and the statute must be applied accordingly. ' " Id. at 1365 (citing Provident Bank v. Wood, 36 Ohio St.2d 101, 105-06, 304 N.E.2d 378 (1973)).

The Sixth Circuit has also stated that in the absence of state authority, federal courts must be "guided by applicable principles of state law and by relevant decisions of other jurisdictions." Aims v. State Farm Fire & Casualty Co. , 731 F.2d 1245 (1984). The Supreme Court of Ohio has stated:

> This court has long held that statutes imposing restrictions on the use of private property must be strictly construed. ... All doubts should be resolved in favor of the free use of private property rather than in favor of restrictions on such use.

Gennari v. Andres-Tucker Funeral Home, Inc. , 21 Ohio St. 3d 102, 488 N.E.2d 174, 177 (1986).

See also Pinnacle Woods Survival Game, Inc. v. Hambden Township Zoning Inspector, 33 Ohio App. 3d 139, 514 N.E.2d 906, 908 (1986) (stating that "[s]tatutes or ordinances which impose restrictions upon the use of private property will be strictly construed and their scope cannot be extended to include limitations not therein clearly proscribed") ; and Cicerella, Inc. v. Jerusalem Township Bd. of Zoning Appeals, 59 Ohio App. 2d 31, 392 N.E.2d 574, 577 (1978) (stating that "[i]n determining the permitted use of property under a zoning

13

Classification in which terms and language therein are not otherwise defined, the common and ordinary meaning of these terms and language must be considered, liberally construing the terms and language in favor of the permitted use so as not to extend the restrictions to any limitation of use not therein clearly prescribed").

The plain language of the (sect.) 1143.11(b) allows for two methods of measuring antenna height. An antenna may either be measured from its base to its top, or from the uppermost point at which it is attached to a building to its top. As long as either of these measurements is shorter than the distance from the base of the antenna to the nearest adjoining property line , there is no violation of the ordinance. Plaintiff's thirty foot antenna will be attached to the building at a height of twelve feet and will be between twenty-seven and thirty feet from the nearest adjoining property line. Since there is no violation of the ordinance as drafted this court need not examine the question of preemption.

The court now turns to the possible preemption of (sect.) 1333.02.(3) In issuing PRB-l, the FCC attempted to reach an Accommodation between the federal interest in regulating amateur radio operators and the state interest in regulating

---

(3) The court will not consider plaintiff's challenge of (sect.)1331.01. Since plaintiff appealed the decision of the Commissioner, he was properly before the Board regardless of the filing of a protest under (sect.) 1331.01.

land use. PRB-l describes the conflict as follows:

Few matters coming before us present such a clear dichotomy of viewpoint as does the instant issue. The cities, counties, local communities and housing

associations see an obligation to all of their citizens and try to address their concerns. This is accomplished through regulations, ordinances or covenants oriented toward the health, safety and general welfare of those they regulate. At the opposite pole are the individual amateur operators and their support groups who are troubled by local regulations which may inhibit the use of amateur stations or, in some instances ,totally preclude amateur communications.

50 Fed.Reg. at 38815.

PRB-l determines that a limited preemption policy is

warranted, and states:

Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the amateur operator with the communications that he/she desires to engage in. . .. We will not, however specify any particular height limitations below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety, or aesthetic considerations must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation to accomplish the local authority's legitimate purpose.

Id. at 38816.

The court concludes that (sect.) 1333.02 is not facially

invalid since it provides a sufficient structure for balancing

state and federal interests as required by PRB-l. By its

15

terms the ordinance provides for a balancing of the effect of

an improvement on neighboring property values against the

reasonable need for the improvement to develop the property.

As interpreted by Defendant, however, reasonable need in this situation involves reasonable need for the particular antenna to carry on effective communication of the type desired. See Defendant' Brief in Opposition to Plaintiff's Motion for Partial Summary Judgement, at 16. Interpreted as such, the ordinance could be applied to give reasonable consideration to both the city's local interests and Plaintiff's federally protected interest in amateur radio operation.

The court concludes, however, that the City of Rocky River did not apply the ordinance in such a way as to provide for the reasonable accommodation of amateur radio communications, and therefore, its ability to apply (sect.) 1333.02 as it did in this action is preempted by PRB-l.

It is only too clear from the depositions of Building commissioner Beirne and Gordon Stofer, a member of the Board of Zoning and Building Appeals, that neither the Commissioner, nor the Board had more than a cursory understanding of PRB-l and its requirements. Despite this, the City's actions might still be held legitimate if the decision making process included a reasonable accommodation of the federal government ' s interest in amateur radio communications. Evidence of such an accommodation, however, is totally lacking.

16

The Commissioner's letter of June 5, 1987 denying Plaintiff's application for a building permit was largely conclusory. There was no indication in the letter that the Plaintiff's needs for adequate communication had been adequately considered. This combined with the Commissioner's obvious lack of understanding of radio communications at the time of his deposition indicates that concerns over property

values and neighbors protests may have predominated in the decision making process.(4) The Board ' s verbal affirmance of the Commissioner's decision, unsupported as it is by any written opinion, fails to show any attempt to accommodate federal interests. Quite simply, there is nothing in the record to indicate that federal interests in amateur radio operation were sufficiently considered, or for that matter even adequately understood, by either the Commissioner or the Board.

Due to the court's holding on preemption, the plaintiff's second ground for summary judgement need not be considered.

---

4 The third ground for the Commissioner's denial of a building permit was the Plaintiff's failure to submit certain technical documents. While the City of Rocky River clearly has the right to require applicants for building permits to submit all necessary technical documents, the Plaintiff has raised the point that the Commissioner's first mention of some of these documents was in the letter denying the permit. It is somewhat unclear from the record the extent to which the Plaintiff met the statutory requirement for a permit. It is unnecessary, however, for the court to reach this point, since the Board's verbal affirmance of the Commissioner's decision was based upon the effect of the antenna on property values and the Plaintiff's need for the antenna.

17

The only issue remaining is that of damages.

IV. DAMAGES

Defendant claims that due to the availability of qualified immunity all claims for damages against the Commissioner and members of the Board in their individual capacities should be dismissed. The Supreme Court of the United States has recognized that "permitting damages suits against government officials can entail substantial social costs, including the risk that fear of personal monetary

liability and harassing litigation will unduly inhibit officials in the discharge of their duties." Anderson v. Creighton, 483 U.S. 635, 638 (1987). In light of this danger, he Court has "generally provid[ed] government officials performing discretionary functions with a qualified immunity, shielding them from civil damages liability as long as their actions could reasonably have been thought consistent with the rights they are alleged to have violated." Id. (citing Malley v. Briggs, 475 U.S. 335, 344-45 (1986), for the proposition that "qualified immunity protects all but the plainly incompetent or those who knowingly violate the law ' "). The applicability of qualified immunity turns on the "objective legal reasonableness" of the government official's action "assessed in light of the legal rules that were clearly established' at the time it was taken. " Id. (citations omitted). "On summary judgement, the judge appropriately may

18

determine, not only the currently applicable law, but whether that law was clearly established at the time an action occurred. If the law at that time was not clearly established, an official could not reasonably be expected to anticipate subsequent legal developments, nor could he fairly be said to know' that the law forbade conduct not previously identified as unlawful." Harlow v. Fitzgerald, 457 U.S. 800, 818 (1982) (footnote omitted).

As noted previously, the case at hand turns largely on the extent to which PRB-l preempts enforcement of the local ordinances in question. While PRB-l indicated that local regulations "must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation, " it also refused to "specify any particular height

limitation below which a local government may not regulate"
and declined to "suggest the precise language that must be
contained in local ordinances." 50 Fed. Reg. at 38816.
In light of this vague language, the court holds that
Plaintiff's rights under PRB-l were not sufficiently clear
that a reasonable government official should have known that
enforcement of the ordinances in question would be violative
of those rights. The conduct of the Commissioner and the
members of the Board is held to be objectively reasonable,
thus entitling them to qualified immunity from damages.
Plaintiff is instructed to submit a brief within twenty
days of the entry of this order detailing the grounds and
19
Basis for any further claims for monetary damages. Defendant
may respond within ten days thereafter.
IV. CONCLUSION
Accordingly, Defendant's motion for summary judgement is
GRANTED to the extent that (sect.) 1333. 02 and 1143. 10 (b) are held
to be facially valid, and the Commissioner and members of the
Board are found to have qualified immunity from damages.
Plaintiff's motion for summary judgement is GRANTED to the
extent that the process employed by the City in denying his
application to erect his antenna is declared invalid.
IT IS SO ORDERED.

What you want is SuperMorse. It runs on a PC, is availiable on Compu$erve.
(HAMNET). It will send groups, disk files, keyboard text, simulated
QSO's, simulated VEC test with scoring, random groups, random words,
allow skill building for head copy and coping behind, etc. You also can
modem a couple PC's together. Also it will toggle the DTR pin so you
can run an oscillator and make your own tapes. It also does Farnsworth.

I just wanted to thank everyone who commented on the K1EA software, either by e-mail or by posting. I've decided that it was worth checking out for myself, so I've ordered a copy... I guess we'll see after I get it and have a chance to work with it some!

I was also glad to see some sort of a contest discussion thread start... after reading code/no-code and related stuff for quite some time, it was nice to see something different! I've been involved in a couple of Field Day setups and the ARRL 10m contest a few years back, but nothing very serious. If my upcoming week-off vacation provides good weather conditions, I hope to be doing some radio and antenna work to get my gear working properly, and I'll give some serious attention to DX and contesting (at least, as much as one can with a quasi-grounded HF6V vertical and 100watts!).

Along with your other good suggestions, I think we need to push the National Park of the Mind concept. Among its other virtues, it is "pre-sold" not only from the standpoint of the of nature of its use but also from the standpoint that it deserves to be preserved despite the more profitable commercial uses the frequencies might have.

"If owls are worth saving, so are hams."

It seems to me (based on my experience) that if a code requirement keeps even ONE otherwise qualified person from becoming a ham, it is a mistake, a disservice to the service. (So far, does that make sense?)

Now you might reverse that and say, "If a code requirement means even ONE life is saved because someone knew the code, it is worth it." But consider: If you don't use it, you lose it. If you don't use the code, you aren't going to know it when you need it. Just like everything else, part of being human.

So it seems clear to me that it's an improper REQUIREMENT. Regardless of how easy it is to learn, regardless of how nice or fun or efficient it is, if it's not something you must know to be a successful ham and to contribute to the hobby, it's an improper requirement.

(Just like having to memorize information you SHOULD look up rather than trust to memory. But that's a different gripe.)

Source record: 6981

As you try to convert HFers to UHF and SHF, you will certainly hear "but I can't work DX, I can't work my buddies in Texas," or whatever.

Ahh, but you can! This morning before work I called CQ on 435 MHz SSB and an HH2 (that's Haiti) came back to me on 145 MHz. New country for me. OSCAR 13 of course. We had a nice little chat, then I had a longer ragchew with a guy in Tokyo. It's like a 150 kHz wide HF band, only without most of the QRM and lids. The gear is available off-the-shelf, and comparable in cost to good HF stuff. Certainly cheaper than a big tower and tribander, and no TVI or neighbor hassles either.

Yes, the downlink isn't UHF on Mode B, but there's also Mode L which is purely UHF (70cm/23cm).

I'm happy a local I've been encouraging has just gotten on 13 this week. Now he says it's my turn to join him on ATV. Same antenna and amplifier...

Come join us on the bird.

I agree. Unfortunately, I don't have a moral high ground to stand on, as I have found myself easily sucked into the morass myself. I am not really anti-nocode, but I find it irresistable to comment when someone writes "we have already PROVED that Morse is useless", or "NO ONE uses it anymore." I should just restrain myself. Everything that I say has been said already.
>
> To those anti-coders who note that I'm an Extra and would prefer to

Just a point concerning what is contained in the battery backed RAM
of the ICOM radios: There is no actual operating code in this RAM.
There is however frequency information that determines where the ham
bands are. This information is contained in the lower 256 bytes of
the 1KX4 ram in BCD format. Apparently when the microprocessor realizes
that there is corrupt data in this area of ram the radio ceases to function.

The lower 256 bytes of the ram are write protected, however one of the
pins on one of the connectors will enable writing to these memory locations.
When I first found out about this FEATURE of my 751, I called ICOM and asked
for a schematic of the ram board, which they supplied without delay. I
built up a little board so that I could suck the information out of the
ram board and store it on disk so thatawhen the battery failed I could put it
back. That was back in 1985, and I have since changed computers so I imagine
that excersize probably will be of little use when the battery does fail.

I am curious to learn if any of the backup batteries have started to fail
in any of these radios. As I recall, the 745, 751, 271 and 471 all had
this ram board feature. If yours has, please post a response and mention
how old it is. Icom was saying 7 years was the expected life of the
battery, and I am wondering how nervous I should be at this point.

Chris,

The input impedance of a half wave dipole is 73+j42.5 ohms. This assumes no losses in the conductors, free space and I believe that the conductors are of a diameter that is negligable compared to the wavelength (its been years since I went through the math to compute this). I don't know anything about MININEC so I cannot help you there, but 80+j40 is close and MININEC may take some of the real world quantities such as conductor diameter and conductor loss into account.

If it is the +j40 that is confusing the issue here, it comes from the fact that there is energy storage in the near field of the antenna. In typical amateur applications we usually tune the antenna length to get a match to 50 ohms. This occurs (or comes closest to occuring) when the dipole is shorter than a half wave. At that point the reactive part of the impedance is near zero and the impedance is a bit above 50 ohms (if my memory serves me correctly). I don't have any of my college texts or an ARRL handbook handy to confirm this at the moment so you might check the handbook.

Jim Summers, KD7F

2694. Lobbying and the ARRL

Newsgroup: rec.ham-radio

Message-ID: <292.2731FEF3@w8grt.fidonet.org>
Source record: 6984

In response to a thread involving having the ARRL become more active in lobbying Congress, etc., Jon Bloom said that in Newington it was considerated an "inappropriate use of funds" to lobby.

One reason given was that there are more effective ways to spend money to accomplish our goals. I fail to see how you could be more effective in influencing the course of legislation than to spend it WHERE legislation is written and enacted in the education of those BY WHOM the legislation is enacted.

Another reason given was that by lobbying we marked ourselves as being not nice people. I guess that means we would become somewhat akin to the slimey creatures greasing palms under the table to get government contracts to build widgets. I know we all joke about Congressmen, but they're not THAT stupid!

How out of touch can one organization be?

Since the only reasons given for NOT lobbying are so trivial, there is no reason to assume the original reason I gave (HQ is afraid to lose their tax exempt status) is not the real reason after all.

So, since the ARRL won't, we must. There's an election Tuesday. Everyone should call his congressional candidates and give a real pitch for a Joint Resolution of the Senate and the House of Representatives in Congress Assembled declaring ham radio the first U.S. National Park of the Mind and ordering a freeze on diminishing its resources and assets pending further study.

>
>AL N1AL

They're definitely not issued at random, but rather sequentially from each
of four callsign "blocks", depending on the class of license.

I don't have the FCC Rule Book in front of me, but roughly it works like this:

Block A calls are 1x2's beginning with W, K, N; 2x1's beginning with W, K, N;
2x2's beginning with A. To date, most zones have exhausted the 1x2's and 2x1's.

Block B calls are 2x2's beginning with W, K.

Block C calls are 1x3's beginning with W, K, N.

Block D calls are 2x3's beginning with W, K.

KH, KL, and others are reserved for Hawaii, Alaska, etc., as before.

Extra calls come from Block A, Advanced from B, General and Technician from
C, Novice from D. If a given block is exhausted, calls are assigned from
the next block in order. For example, 6-land Block C's are now exhausted,
so new Novices, Technicians, and Generals will all get 2x3 Block D calls.

Corrections/additions to the above are welcome.

Subject: Covenants, Callsigns, and Congress

Yesterday's _Honolulu Star-Bulletin_ had a slick four-color brouchure in it advertising the final increment of Mililani, one of O'ahu's most notorious anti-antenna developments. In the back, there was a section about the homeowner's association:

Mililani Town Association

"An integral part of the community since its first meeting in 1969, the Mililani Town Association serves as a built-in business manager for all Mililani property owners.

"'Our prime responsibility is overseeing the upkeep of the community and maintaining overall values,' explains Mililani Town Association Board President Eric Matsumoto, now in his seventh year in the post. 'Basically MTA conducts all the management activities of a business except our product is Mililani.'

"Every property owner is an automatic member of MTA and all homeowners are assessed $12/month per household for dues.

"Under the direction of MTA Executive Vice President/Manager Mary Treuhaft, MTA employs a full-time staff of 30 including 15 administrative staff members and 15 maintenance workers and groundskeepers.

"By charter, MTA is responsible for the upkeep and maintenance of all common areas in Mililani, and the upkeep and operation of all community recreation centers and facilities (list deleted).

"Treuhaft and her staff are also charged with the ongoing enforcement of extensive design covenants and rules of conduct that have been put in place to ensure the planned beauty of Mililani."

(remaining sales text deleted)

Well, there you have it. They don't hide their CC&Rs, they're *proud* of them! Unfortunately, as long as Hawai'i continues to be a sellers',

rather than buyers', market, there's little hope of getting around this.

BTW, the developer of Mililani is an outfit called Oceanic Properties, Inc. The main O'ahu CATV company is called Oceanic Cable. Don't know if there's a connnection, but I'd bet a coupla beers on it :-).

Those of you wishing to express a opinion about Mililani's CC&Rs may contact:

Mililani Town, Inc.
95-102 Lalei Place
Mililani, Hawai'i 96789
(808) 623-2821

-...-

Seen on the inter-island ramp at Honolulu International yesterday:

A 737-100 in British Airways colors (navy blue/gray), except for the Aloha Airlines' orange script "Aloha" along the top of the fuselage.

Tail number/callsign: "G-BADP" !

What I want to know is how did it manage to get here...anyone know the ferry range of a 737-100?

-...-

And finally....

>You put it very well, and I concur completely except for your fear of Congress.

>We have the best Congress money can buy. [:-(

Or, to put it another way, "No man's life, liberty, or property is safe while Congress is in session" - Mark Twain (or maybe Will Rogers)

>standpoint" immoral and possibly criminal? (-;

Bad analogy!! And we have gone over this one before.

There is more than one university or college of higher education. In fact
there are so many choices, it boggles the mind. Your choice of educational
curriculum exists. If you don't like what Stanford requires, choose some
other one.

For access to the ham radio spectrum, there is only ONE have radio and
only FIVE classes within it. And **ALL** of them have the same code
requirement.

In fact we "no coders" are actually trying to make a choice available
just like there is in higher education.

> persons will be closer to Saudi Arabia than I am now when I
> send a MARS message.

First off, don't bother looking for someone closer to Saudi Arabia. That isn't how the MARS traffic nets are organized. You would insert the message locally, and they would see to the routing themselves.

Second, the most recent information I have from a local friend in MARS is that there is no service to land based units, but some of the Navy ships DO have service.

There will be those who tell you that ANY address with an APO or FPO number can be handled. That isn't necessarily true. It depends on whether there is MARS service at the delivery end of the path. That is often not the case for a variety of reasons. It also changes from time to time.

Therefore, if you want to try it, send it to me e-mail and I'll check the address. Be certain to include the addressee's full name, rank, SSN, and address as used for mail including APO/FPO. Also, include the sender's full name and address including telephone number.

2700. Computer-aided code instruction

Newsgroup: rec.ham-radio
Date: 1990-11-03 00:24:13 UTC
From: greenba@gambia.crd.ge.com
Message-ID: <GREENBA.90Nov2192413@gambia.crd.ge.com>
Source record: 7017

The best way I know to (1) learn the code or (2) increase your speed
is the program pair QRS/QRQ available as shareware. The unique feature
of these programs is that they not only send you random letters, they
listen to what you copy on the keyboard. Then they give you a score.

QRS sends a letter and waits for you to type the correct answer.
It times you for 30 letters and computes your copying speed.

QRQ sends a stream of letters and lets you "copy behind". If you get
30 letters correct, it sends you a ROGER and raises the speed 0.1 wpm.
Any error makes it reduce the speed 0.1 wpm. Just sit back and copy,
and the program adjusts to the best practice speed for you.

These programs are addictive!

Available from Public Brands Software, 317-856-2087, on ham radio
disk HR12.0 -- along with some other interesting programs.

I think this is one big reason so many of us are uneasy about eliminating the code test. As time goes on, the theory tests keep getting easier and easier. At least 13 wpm code will always be 13 wpm code.

* SpaceNews 05-Nov-90 *

Bulletin ID: $SPC1105

=========
SpaceNews
=========

MONDAY NOVEMBER 5, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* PIONEER 11 STATUS *
====================
The Pioneer 11 spacecraft emergency support continues with 70 meter antennas
in high power transmitter uplink configuration. Non-coherent downlink
telemetry has been processed by the Ames Research Center. Following the
uplink with the 70 meter antenna in Spain on 28-Oct-90, the 70 meter antenna
in Goldstone was unable to acquire 3 way downlink. The project at Ames
reports commands are getting into the Pioneer 11 spacecraft, but the planned
receiver swap was not successful.

[Information via JPL]

* MAIL BAG *
============
I've been receiving quite a few questions recently about DOVE-1/OSCAR-17.
First of all, DOVE transmits on a frequency of 145.825 MHz FM. This
downlink carries spacecraft telemetry (AX.25 AFSK packet radio format)
as well as synthesized voice transmissions. To date only telemetry has
been carried on DOVE's downlink as spacecraft testing continues.
After new software has been loaded and tested on DOVE, the Votrax speech
messages should be heard. It should also be mentioned that DOVE-1 does
not have mailbox capabilities. It was designed primarily for downlinking
digitized voice messages to Earth.

Q: Could you carry Keplerian orbital data in SpaceNews?
A: Since there are other outlets for Keplerian orbital data, I would rather
not repeat that information here. (Sorry!)

Q: Are they any satellites that I can access with an HT?
A: Well, you could get a signal into RS10 or RS11 on Mode A with nothing
more than a handheld 2-meter transceiver if you were to key the PTT
button with CW, but this usually results in a very chirpy signal!

FM and other "constant carrier" emissions should be avoided when
communicating through amateur satellite transponders.

Q: Is "SpaceNews" associated with the trade journal "Space News"?
A: No. "SpaceNews" has been in existance since November 1987.
It is dedicated to topics of interest to Amateur Radio operators
worldwide and is non-profit publication without connection to any
organization, public or private.

* OSCAR-13 NEWS *
==========
Command Stations performed magnetorquing procedures near perigee of orbits on
October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue throu 26-Dec-90. The spacecraft
attitude is BLON = 180 and BLAT = 0.

>
>Let's face it, ham radio just isn't the cutting-edge hobby it once was,
>not with competition from computers, video games, etc. (none of which
>require a license of any kind).

It's true that ham radio is not the cutting-edge hobby it once was. And
that's due in large measure to hams clinging to obsolete techniques,
which is not in itself totally harmful, but, when it is embedded in the
entrance requirements, is deadly to attracting people who prefer not
to renact the past, but instead to invent the future.

If you believe that an amateur license exam where Morse makes up less than
50% of the score will inevitably result in glorified CBers and ham XYLs
overrunning the microwave bands, then there is no hope for amateur radio.
I believe that, with the obstacle of an exam which has fully 50% devoted
to an arcane historical manual modulation encoding removed, an aggressive
recruitment campaign can succeed in attracting bright young people once
again to the cutting edge of communications, a revitalized amateur radio.

If we only get an additonal 5% growth, and only a few percent of those are
the sort of activists who have caused the explosion in computers, then we
will increase the ranks to the doers and dreamers in ham radio a hundred
fold. Some will joyfully accept the advances in digital communication
and extend them manyfold. Some will delight in satellite communication
and join the now thin ranks as supporters and builders of future systems.
Some may be challenged to build cellular repeater systems. Others may
wish to explore picture transmission. A few may even learn CW and desert
to the DC bands to become DXers. Oh well, you can't win them all. :-)

This is the traditional generation gap you are experiencing. Every older
generation truely believes that the young people are going to hell and
that civilization is on the brink of collapse. In my generation it was
beatniks, Elvis, and that devil music rock and roll. Later it was protest,
hippies, and Jimi Hendrix. Today it's punk and rap. Yet during all that time
we won and lost wars, revolutionized electronics, sent men to the moon, and
invented teflon frying pans. Relax, be happy mon! The Dow is at 2400 vs 700
ten years ago, our national debt of three trillion dollars is a smaller

percentage of our GNP than at any time since World War II, at the peak of the S&L crisis more new banks were formed than failed. Somehow civilization survives the culture shock of new ideas and new ways and carries on. As Darwin said, "Adapt or die!". Or as a younger thinker said, "Go with the flow.".

>Below 30 Mhz, if the Amateur Radio Service does not reverse the decent into
>in your face street behavior, commercial interests will have all the ammunition
>they need to justify seizing all of the ham spectrum as being too valuable
>to waste on a bunch of radio hoodlums.

We just gained two new bands at HF as I recall. The commercial interests are abandoning the "worthless" HF spectrum for satellite links, fiber optic links, and microwave links as quickly as possible. Soon no one will want HF but the few remaining retired hams and a few die hard propaganda broadcasters. The future of communications is upstairs in the microwave spectrum. We can lose our share of this spectrum, our future, if we continue to put archaic obstacles in the way of those young turks who can develop it.

It won't be easy reversing the image of ham radio as a cliquish bunch of weird old men playing with radios. But, with the removal of an archaic obstacle to entry, there is a chance that it can be done. With a lot of hard work and some smart promotion, the old girl may come back to life yet.

Well it is how the DXers do it already. Send those green stamps. DXCC at any price. I understand that some enterprising VECs will sell you an Extra class license for $100 today. Then you can get on your CW computer and impress the low caste Novices at 50wpm and 2kw just like a real Extra. Phooey! Just stay on the DC bands and don't bother those of us Upstairs where the future of communications is happening.

Gary KE4ZV

Grrrr! Boy, I'm in a nasty mood today!

Definitely. But how about putting a big fence around ALL the parks and
refuse to allow anyone in who cannot prove by a test that they can ride
horseback. There are good reasons for learning this skill, too. What if
you car breaks down in an emergency? Horseback riding is also a very
worthwhile and enjoyable skill. It is the traditional mode of transportation.
And besides, if we don't force the coming generations to learn how to ride
a horse, that would be the same as denying them the opportunity.

BTW I never learned how to ride a horse faster than a trot, but that's
good enough to get into some of the more remote parks that no one ever
goes to that are being threatened by commercial interests.

:-)

An item on the latest amateur radio Newsline report has sparked my interest.

It mentioned digital audio broadcasting or DAB. This system has been tested

and it seems that according to the tests it is much better than standard

fm. What kind of modulation scheme does it use? How wide a signal is generated?

Any information would be appreciated.

ARRL BULLETIN 41 ARLB041
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE ARRL HAS FILED ANOTHER REQUEST WITH THE FCC FOR MORE TIME OF
COMMENT IN THE MATTER OF PROPOSED CHANGES IN MORSE CODE TESTING FOR
DISABLED PERSONS, PR DOCKET 90-356. IN ITS APPLICATION FOR REVIEW,
THE LEAGUE REQUESTED 48 DAYS FOR COMMENT ON THE PROPOSAL, STRESSING
THE IMPORTANCE OF THE PROPOSED CHANGES TO THE AMATEUR RADIO SERVICE
IN GENERAL AND TO THE VOLUNTEER EXAMINER PROGRAM IN PARTICULAR.

THE APPLICATION FOR REVIEW ASKS IN EFFECT THAT THE COMMISSIONERS
OVERTURN AN EARLIER STAFF DECISION NOT TO ALLOW WHAT THE LEAGUE
CONSIDERS ADEQUATE TIME FOR COMMENTS TO BE FILED.

ARRL BULLETIN 44 ARLB044
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE ARRL AWARDS COMMITTEE HAS ACCEPTED THE FOLLOWING RECOMMENDATIONS
OF THE DX ADVISORY COMMITTEE.

GERMANY. EFFECTIVE OCTOBER 3, 1990, THE GERMAN DEMOCRATIC REPUBLIC,
Y2 THROUGH Y9, IS DELETED, BECAUSE THAT COUNTRY WAS ABSORBED BY THE
FEDERAL REPUBLIC OF GERMANY ON THAT DATE. CONTACTS WITH Y2 THROUGH
Y9 STATIONS ON OR AFTER OCTOBER 3, 1990, AND CONTACTS WITH DA
THROUGH DL STATIONS ON OR AFTER SEPTEMBER 17, 1973, WILL BE CREDITED
AS THE FEDERAL REPUBLIC OF GERMANY.

YEMEN. EFFECTIVE MAY 22, 1990, THE PEOPLE'S DEMOCRATIC REPUBLIC
OF YEMEN, 7O, AND THE YEMEN ARAB REPUBLIC, 4W, ARE DELETED. IN THEIR
PLACE, A NEW COUNTRY, YEMEN, 7O, IS ADDED EFFECTIVE THE SAME DATE.

MARCH 1, 1991, HAS BEEN SET AS THE EARLIEST DATE FOR SUBMISSION OF
CARDS FOR CREDIT FOR THE NEW YEMEN LISTING. PLEASE DO NOT SUBMIT
CARDS FOR CREDIT PRIOR TO THAT DATE. HONOR ROLL MEMBERS WHO HAVE
MADE CONTACT WITH YEMEN SINCE MAY 22, 1990, WILL BE ABLE TO UPDATE
THEIR CREDITS DURING THE MONTH OF MARCH 1991, PRIOR TO PUBLICATION
OF THE NEXT HONOR ROLL LISTING.

ARRL BULLETIN 42 ARLB042
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 2, 1990
TO ALL RADIO AMATEURS

THE FCC HAS DENIED THREE PETITIONS, INCLUDING ONE BY THE ARRL,
REGARDING POWER INPUT IN AMPLITUDE MODULATION, A3E, RADIOTELEPHONE
OPERATION. THE PETITIONS HAD REQUESTED THAT GRANDFATHERING OF THE
AM LIMIT OF 1,000 WATTS DC INPUT, WHICH EXPIRED ON JUNE 2, 1990,
BE REINSTATED. THE FCC, WHICH RECEIVED MORE THAN 820 COMMENTS, WAS
NOT PERSUADED THAT INTEREST IN AM SIGNIFICANTLY EXCEEDS THE COMMISSION'S
1983 ESTIMATE. THE ARRL HAD ARGUED THAT INTEREST IN AM WAS STEADY
OR EVEN INCREASING, AND THAT THE NEW RULE WOULD RESULT IN A LOSS
OF PRIVILEGES FOR AMATEURS. AS A RESULT OF THIS FCC RULING THE MAXIMUM
LEGAL POWER ON AM REMAINS 375 WATTS CARRIER POWER OUTPUT, WITH 100
PER CENT MODULATION. AT THE SAME TIME, THE FCC ALSO DENIED A
PETITION SEEKING TO REMOVE AMPLITUDE MODULATION FROM THE LIST OF
LEGAL MODES OF OPERATION.

]It doesn't seem practical as a chat machine what with all the individualized
]codes required to key it. It would be a practical way to control patch
]access though. As you probably know, I'm not keen on non-emergency autopatch.

There is a very practical way to control patch access, and it has the advantage
of being legal and required at all times except for emergency traffic:
control operators.

I am curious how many patches there are in the land with full time control
operators, as required by regulation. I suspect that very few autopatches
actually have control operators [and, that includes remote means that
the user himself could employ to be the control operator - on a different
frequency than the repeater itself].

>just as high with 400 W.

I agree, with just a few exceptions (such as the low bands when QRM within Europe is extreme - we can hear the 400W Gs, but a 400W W doesn't have much chance - but the effect of this on scores wouldn't be that much). Actually, not all that many hams in the U.S. have amps capable of 1500W out, most are in the 800-1200W range, so the effect of running 400W should be more like half an S-uint. The big problem with running 400W out in a contest here on 75 & 160 is that practically everyone's antennas are just about the same. At N4WW I had a dipole on 75 - it was at 120', which is higher than most people, but the advantage over some W1's inverted vee is about 0 db. Take 400W into a big pileup on 75 with an antenna thats the same as everyone else's, and that 3db or less difference in power (which sounds practically insignificant when expessed in S-units), now that 3 db means you just don't work the guy unless you get lucky. On 40, on the other hand, N4WW's 4-el KLM is a much better antenna than the average guy in the pileup has, so I still got through most of the pileups in just a couple of calls (of course, I was spending so much time screaming on 75 trying to work somebody that my 40 meter totals on the first night were pretty bad :-)

>especially in the SSB contest, the bands are so crowded that only the

>rate necessary to compete.
>
>Scott K9MA

Right. This is a big problem on 20, where I only had about 200 Q's and 54 countries by Saturday morning (which is WAY below what it should have been). On 10, power is not really much of a factor. At the 24 hour mark I had 580 Q's and 91 countries on 10, which is pretty good.

Ron WA6DGX

>I think this is one big reason so many of us are uneasy about eliminating
>the code test. As time goes on, the theory tests keep getting easier and
>easier. At least 13 wpm code will always be 13 wpm code.

Mere difficulty is not the goal. If someone finds it extremely easy to pass a test of the basic minimums needed to properly use a radio resource, then they should be most welcome (unless and until they end up deciding not to use their knowledge properly).

A more thorough test does not increase in difficulty for someone who really knows and understands the material as it would for someone who is just memorizing a bunch of facts. Making a test long and thorough would, of course, means someone has to work on creating it all. But I see no problem why people should not expect to be taking up to 2 to 3 hours or more to take a test for privileges that can be renewed by mere paperwork for a lifetime.

1. There is a lot of chaff in the current theory test. We only need to test for the wheat.

2. The test should thoroughly and completely test for a full understanding of just the wheat.

RTTY DX Notes 1of3 11/2/90

RTTY DX Notes for week ending 2nd November 1990
BID: $RTDX1102
Part 1 of 3.

I was going to write something about AMTOR operation, but could not do
it under about 5,000 bytes. The mind boggles over some of the
descriptions bandied over the air, so I went and read my books again.
They don't agree with what has been said over the air, so maybe my
books are wrong. Or maybe some other people should read some books,
especially after page 4.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3XJ, VK2EG,
W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for
your good information.

SB RTTYDX @ ALLBBS $RTDX1102B
RTTY DX Notes 3of3 11/2/90

RTTY DX Notes for week ending 2nd November 1990
BID: $RTDX1102B
Part 3 of 3.

QSL Information:

D68VT says to QSL via K5VT.

JX7DFA will QSL via Per-Einar Dahlen, Romoslia 58, 7029 Trondheim, Norway.

ZK1AP is Pierre Asselin At Box 494 Rorotonga, Cook Islands.

KP2N collects his cards via WA4WIP.

KP2BH is ok in the Callbook.

VP8BFH is via Box 60, Port Stanley, Falkland Islands, though a little hard to get cards from him.

CN8YP is via FDXF or F6FYP.
CN2JF is via WA0RJY.

FR0P says send cards via F6BFH.

PJ9W is OH2BGD when he is at home.

CY9CF (the shortest DXpedition on record) will collect his card from Box 4204, F-97500, St Pierre Et Miquelon Is., via Canada.

V73BN says to QSL via Box 8147, APO San Francisco, CA 96557.

Notes of Interest:

V73BN says that he will be QRV most days around 1100 to 1200Z. He may also be around at 0430Z some days. He is looking for AMTOR contacts.

Malpelo Island should be active now, though nothing has been heard at the time of writing these notes. QSL to HK3DDD.

Marianas Islands, KH0AM should be active at this time, again nothing heard. QSL via JE1CKA.

Banaba Is. T33T will be active from November 7th to November 21st, all bands. QSL to OH3GZ. Also, KIYO (ex-ZK3KY) will be active from there as we write these notes.

Juan Fernandez. CE0ZZZ should show up from November 10th until the 18th of November according to F2JD, who is one of the operators.

St Pauls CY9 appeared for about 4 hours. Nothing has been heard since.

GL DE DX1.

SB RTTY @ ALLBBS $IRDX1190
IRDXA 11/90 Bulletin

BID: $IRDX1190

IRDXA Project Status Report 11/90

The International RTTY DX Assoc (IRDXA) provides RTTY equipment to
DXpeditions and resident amateurs willing to provide contacts from
rare DXCC countries.

Comoros - By now everyone should have worked Vince Thompson K5VT as
D68VT. He had some trouble with a Telereader, but we solved it with a
TV set obtained locally.

Thailand - RTTY is still not authorized. IRDXA PK-232 will be active
at HS1AC (Science Museum) when RTTY is legal.

Tristan De Cunha - Andy, ZD9BV and his bride ZD9CO are both active.
Listen to his Wed/Sun sked with W4FRU on 28466 at 1700.

Rodriguez - 3B9FR made a few contacts with his IRDXA RTTY GEAR but has
been very scarce lately on any mode. Please encourage him.
Papau New Guinea - P29BT will be QRV with IRDXA gear in November.

Malpelo - will be QRV RTTY for the 1st time in Nov. 90 with HK1LDG at
the keyboard, IRDXA equipment in hand. Please, extra greenstamps with
QSL for new one on RTTY.

S. Georgia/S. Sandwich - This very ambitious project has been
scratched for now. Anyone want to go? We're working on another
approach to activate S. Georgia again.

Malawi - IRDXA sending equipment to 7Q7LA as soon as we can raise
about 50 for postage. This potential new one negotiated by W8SEY.

Juan Fernandez - CE0ZZZ (with F2JD = KL7GRF) should be QRV 10 Nov.
with CE3BFX on the keys. G/S with QSL for RTTY new one please.

Bangladesh - Vince Thompson K5VT plans to return as S2VT in late Feb.
with IRDXA RTTY gear. X your fingers.

IRDXA still needs your help. Ongoing projects include CE0Z, 7Q, etc.
```

Contact IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.
Phone (213) 322-7112 or fax 213-322-7114.

2723. Re: Identifying mobile antennas

Newsgroup: rec.ham-radio
Date: 1990-11-03 22:57:56 UTC
From: alan@km4ba.UUCP
Message-ID: <185@km4ba.UUCP>
Source record: 6939

Most of the open air coils are just the old
1/2 wave over 1/2 wave antennas. The lower element
usually does need a coil, since the 1/2 wave is
a high impedence feed.

The open coil is just is just a phasing element to get
the radiators in phase so they add, rather then subtract.
A more typical example is the "hairpin" phase method on
a ringo ranger.

The advantage of the open coil is higher power ratings, and
simplicity. (Spell that cheaper!) It is also easier
to make the 800 mhz phasing element this way.

The disadvantage is that the match combinations are somewhat limited.
They also tend to whistle in the wind.

Most people think it must be the best, since it is what cellular
uses. It has the "look".

The higher gain antennas are usually closed coil, and use
a 5/8 wave over 1/2 wave construction. You can get 1-2 db
more gain that way.

The cheapest antennas, and most dual Band antennas are
1/2 wave over 1/4th wave. It has a low impedence feed,
and does not require a coil. it is more sensative to
ground plane then the 1/2 wave variants.

A larsen person told me you just design what ever lower
element you want. The tip is at high impedence, so you
use what ever phasing is neccessary to get the elements to
add + match the feed impedence of the lower antenna.

We also had some interesting discussion regarding 1/2 wave
antennas vs the more common 5/8th wave antennas, and their
gain on *typical mobile installations*.

BTW, you can get a 5/8 over 1/2 wave 2 mtr antenna with 5db
gain. It does not work well bumber mounted, but put it
on a fender or roof, and it works great. It is the
Hustler CG-144. 2+ extra db over a 5/8th wave!

Now if I can just get that field strength range, and mobile
turntable finished in my backyard, I can really do some work! :-)

Actually, you can build the open coil designs easily using copper.
It is harder to do with stainless, but you can test designs very

easily with 12 gauge solid wire.

Try building one sometimes!

2724. Re: Drifter-1 balloon beacon

Newsgroup: rec.ham-radio
Date: 1990-11-03 23:51:10 UTC
From: keith@hpfcdj.HP.COM
Message-ID: <18230047@hpfcdj.HP.COM>
Source record: 7023

Yet another announcement regarding a balloon launch:

Western Vision Network (WVN) will be launching a helium filled balloon that will carry amateur television on November 18, with an alternate date of December 2 in case of bad weather. The launch site will be northeast Denver near Stapleton airport. The balloon is expected to travel approximately 200 miles toward the Colorado-Kansas border before it reaches an anticipated altitude of 90-100,000 feet. At that altitude, the original 5' diameter balloon will have expanded to 25', at which time it will burst and hopefully return saftely to earth, being slowed by a small chute.

The balloon will be carrying a 4 pound payload. A small CCD color camera, telemetry package, CW beacon (on 2M), 1W ATV transmitter and a 12V lithium battery pack (good for about 17 hours) round out the equipment. The ATV audio contain the telemetry reporting temperature, humidity and barometric pressure. The video will be transmitted on 426.25 and the beacon can be heard on 144.34. A large tracking crew, including 2 aircraft, will be used to recover the payload. The aircraft will also be equipped with ATV gear, and if their signal can be reliably copied will provide additional excitment during the recovery process.

The ATV signal from the balloon is on the input frequency of the WVN repeater, so anyone along the front range of Colorado that can receive this repeater will be able to observe the operation from start to end. A vdieo tape of the event will be produced.

Source record: 6938

Does anyone on the list recall an antenna from the 1950s called a "T2FD". I used one successfully but that was years ago and I do not have the specs. As I recall it came from CQ or QST. It was a wide-spaced folded "dipole" with a load resistor. THanks for any useful information and esp. for specs.

Hello Dan,

There is a packet BBS running out of the American Embassy in Saudi Arabia
using the callsign 7Z1AB. The BBS is intended for handling mail only traffic
for deployed U.S. military personel stationed in the Gulf region.
If you're intentions are to pass traffic through the net, you can E-mail
a note to Jim Stone - who set up the link, explaining how much traffic
will be passed and work out the logistics.
the E-Mail address for Jim Stone is:

"Jim%taueng.bitnet@mitvma.mit.edu"

Good luck
es 73,
Rich

And many boaters openly admit that they belong to yacht clubs with resident "VECs" who pass out licenses without giving tests. (Don't deny it, ARRL Staffers. I've read their messages concerning it on the SAILING Sig on Compu$erve.)

~~~~~~~~~~~~~~~~~

Initial guidelines for the Microwave and RF GROUP Conference.

1) As of present, this conference shall be open ended. As things progress, we'll see how the Conference is developing and then determine if there is a need to fine-tune our scope of discussion.

2) It is possible that this Forum may become an important motivator of the Microwave and RF industry as a whole. Ideas shared in one place strangely seem to find their place in an application later on. Discussions on this forum and the contents of all message traffic promulgated herein are declared Public Domain. Furthermore, this conference is a Public Conference and makes no provision for private messages.

3) The Owners/Operator of RES-Q (TM), hereby declare themselves not responsible in any case of posted information which may be proprietary, confidential or secret. In any such case, liability shall be reverted to the originating BBS's owner/operator and poster. RES-Q (TM) will in no way be responsible for filtering such information but retains the rights to do so.

4) Participants of the Microwave and RF GROUP Conference are solely responsible for what they do with information obtained from the Microwave and RF Conference. RES-Q (TM) makes no warranties express or implied as to our performance as Top Star for this GROUP.

5) Access to the Microwave and RF GROUP Conference is not restricted. A professional, yet congenial, atmosphere is desirable.

6) The Microwave and RF GROUP Conference may not be "ported" outside of GroupMail without prior consent of RES-Q.

7) Finally, let's make this Conference one of the Top 5!

Your Moderator is Bill Kreps

Hmmm. I have heard VVV and CQ sent as markers, but "C" sent by
itself is a new one. I have also heard a few stations send "DE
callsign" by itself as the marker.

I think this one is in effect already. I just saw a posting in
the FidoNet HAM echo from someone who says he just passed the Novice
exam and is waiting for his ticket. He wanted to know what bands and
frequencies he could use as a Novice! I thought that stuff was on the
exam somewhere.
This individual is planning to spend almost four thousand
dollars for a top-line HF transceiver. With that kind of money, he
should be granted the Extra class license! <half-smiley goes here>

2735. CQWW Poop From PJ

Newsgroup: rec.ham-radio
Date: 1990-11-04 22:03:21 UTC
From: reisert@ricks.enet.dec.com
Message-ID: <3368@ryn.esg.dec.com>
Source record: 6954

[relayed from YCCC PacketCluster (tm)]

Msg #111 From: K2EK Date: 4-Nov 1610Z Subj: CQWW Poop From PJ

After all the dust settled in PJ:

PJ9W PJ1B
160 354 43 14 571 49 19
1311 92 22 1469 99 24
2319 130 31 2166 118 31
5440 165 37 5180 180 38
5750 165 38 5900 180 38
10 5400 155 38 5819 180 39

20574 750 180 21105 806 189

Both duped. PJ9W 40M country count expected to drop to abt 125 (per OH2BAD).
PJ1B had 13 ops (3 for YCCC) - 65 ops at PJ9W.
Typical PJ1B ant was stacked C-C Skywalker. PJ9W had B I G antennas.
Like 3 el yagi on 75, stacked full size on 40, 4X 5el colinear stack on 15.

2736. Re: Digital Audio Broadcasting or DAB.

Newsgroup: rec.ham-radio
Date: 1990-11-05 00:23:24 UTC
From: caf@omen.UUCP
Message-ID: <42@omen.UUCP>
Source record: 6968
Cross-posted to: rec.radio.shortwave,rec.ham-radio

A number of DAB systems have been proposed. Generally, they use compression to lower the bit rate from that used on CDs; there will be controversy about the audible effects of this compression.

The DAB systems use various forms of redundant transmission to provide the listener with reception virtually immune to multipath.

Field trials of the European Broadcast Union DAB system yielded CD audio quality in situations that make FM unlistenable.

DAB can be delivered locally with normal towers, or nationally via satellites.

Credit for the following info goes to Bill Goia K2EK from the YCCC
PacketCluster network......

After the dust settled down in PJ-land, here are the scores from PJ1B and PJ9W:

PJ9W PJ1B
QSOs/Zones/Countries QSOs/Zones/Countries
160 354/14/43 571/19/49
80 1311/22/92 1469/24/99
40 2319/31/130 2166/31/118
20 5440/37/165 5180/38/180
15 5750/38/165 5900/38/180
10 5400/38/155 5819/39/180

20574/180/750 21105/189/806

The QSO numbers are after-dupes....
The PJ9W 40m country count is expected to drop to 125 (per OH2BAD)

PJ1B had 13 operators
PJ9W had 65 operators

Typical antennas at PJ1B were stacked Cushcraft Skywalker yagis
Typical antennas at PJ9W were: 3el yagi on 75m
stacked full-size yagis on 40m
4x5el collinear stack on 15m

Interesting.....

2738. ICOM IC-3220A Mod for Crossband Repeat

Newsgroup: rec.ham-radio
Date: 1990-11-05 02:46:55 UTC
From: RTDIMO%GOR1@LEAV-EMH.ARMY.MIL
Message-ID: <9011051058.AA01390@ucsd.edu>
Source record: 6945

Any ICOM engineers out there? I need help with figuring out why
one IC-3220A will work crossband repeater mode and another one with very
close serial number will not. An undocumented mod allows crossband repeat
function. With radio on, hold BAND and SET key till flashing L appears
in lower right hand corner of display (must be in dual mode). This allows
receive on 440, with retransmit on 2 meters. My friends radio works, but
mine doesn't. Any ideas why? Does a diode have to be cut? (My friend
says he didnot cut anything other than D4 and D5. This allows extended
frequency range on both bands. This works great.)
My friends' radio will retrans. When I enter this mode, my radio receives
440 signal and keys up 2 meters, but it does not transmit audio. Same on
receive, it receivesthe 2 meter signal and keys up 440, but doesn't
transmit any audio. ????. Thanks.

2740. HR2510 Mods

Newsgroup: rec.ham-radio
Date: 1990-11-05 03:48:43 UTC
From: vester@canisius.UUCP
Message-ID: <2994@canisius.UUCP>
Source record: 6947

I have a Uniden HR2510, and I had a technician replace the driver, and final transistors. It now does 10 Watts on AM dead key, and 40 Watts on Side Band (all are RMS readings). I still would like more power. Up here in Buffalo, 10 Watts AM, nor 40 Watts on sideband is still not enough to talk some skip.

I have heard of people getting 90 Watts out of this radio RMS sideband, but I have no idea on how to do it. Dual finals? Maybe, but I thought I'd ask you if you knew anything about this, or had some hints. Please don't send me mail saying, "Get a Ranger". I don't want to use a linear amplifier because I have had them, and they come over the neighbors cooking utensils, and vast other appliances.

Any help would be appreciated, even a phone number!

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 03 to November 13, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 28 October and 03 November was Low. Perhaps the most exceptional event of the period was an eruptive prominence which occurred on the northwest solar limb. This prominence produced an x-ray enhancement peaking near a class C1.3 level at 21:58 UT on 02 November.

It was thought that the solar flux had reached it's minimum early last week, but this proved to be inaccurate. It is apparent that this solar cycle is proving difficult to predict (unlike the previous two solar cycles where activity pulses were relatively well predicted).

Geomagnetic activity throughout the week varied from quiet levels to minor storm levels at most latitudes. Middle latitudes experienced an increase in geomagnetic activity on 30 October in response to a well positioned coronal hole. Activity remained at unsettled to active levels until 01 November when activity calmed to predominantly quiet levels. There was basically one minor-storm-level perturbation at middle latitudes, reaching a peak K-index value of 6 between 00 UT and 03 UT on 30 October. This fluctuation occurred over a period of approximately one hour. The variance of this fluctuation was relatively low. High latitudes became unsettled to active on 29 October and experienced several bursts of relatively low-intensity minor storming until near 02 November when activity returned to predominantly unsettled levels.

Propagation throughout this week was mostly normal with very good propagation at mid to low latitudes and mainly fair propagation at high latitudes. The only exception was the period of increased magnetic activity. During this period, high latitudes experienced noticable auroral-induced signal flutter which was - at times - quite strong, particularly during the late evening/early morning hours. Middle latitudes, likewise, experienced occasional periods of fair to poor propagation conditions with increased fading and signal flutter. Low latitudes escaped most of the effects from this activity. Overall signal range during this period was also noticably reduced at many locations (particularly over the higher latitudes).

Auroral activity was not visible at low and many middle latitude locations. Lunar phase reduced the visibility of auroral activity at almost all latitudes. High latitudes were least effected and noticed periods of moderate auroral activity, particularly on 29 and 30 October. Activity subsided thereafter.

The 10.7 cm solar radio flux will begin to rise on 05 November as the more active hemisphere of the sun begins to rotate back into view. This week could prove interesting for solar activity. The active regions which spawned the major flare on 24 October, are due to return this week. Current models

suggest that these regions have probably returned back to a relatively stable state, but there is a slight possibility that the instability has been retained. If this proves to be the case, the return of these active regions could herald in an increased risk of major flare activity. However, judging by the characteristics of old flare-producing regions which have been observed in past months, the previously unstable regions have probably stabilized or died and will likely return uneventful. The solar flux is expected to begin increasing this week to a peak value of near 215 to 230 (the model being relied on at the moment suggests a peak value of near 220). M-class flare activity is expected to increase at any time now and should be much more prevalent throughout the coming week.

The geomagnetic field is expected to remain at quiet to unsettled levels until 06 November, when potential effects from a coronal hole should increase magnetic activity to active levels. This increase in activity should peak on 07 or 08 November. There is a risk of minor storming with this impulse of activity at middle latitudes, while high latitudes may experience bursts of major storming. The last rotation of this solar region occurred on 10-12 October when strong minor storming occurred at middle latitudes, while high latitudes experienced major to severe storming. The risk for some repeated strong geomagnetic activity exists with the return of this recurrent region. Current predictions suggest that geomagnetic activity will likely remain confined to active levels with a risk of sporatic minor storming at middle and high latitudes. Conditions should return to quiet to unsettled levels by 09 or 10 November. Should activity surpass levels currently anticipated, a geomagnetic storm alert may be posted. The predicted planetary A-index value for 06 November is 18, which suggests peak planetary K-index values will likely reach 4 and possibly 5 at middle and high latitudes (with higher latitudes sustaining peak K index values of 6 with associated A-index values near 32 to 40). Middle latitude regions will likely observe A-index values between 23 to 30.

Auroral activity will become enhanced near 06 or 07 November, concurrent with the anticpated increase in geomagnetic activity. Activity will likely remain confined to mostly moderate levels at middle and high latitudes. There is, however, uncertainty regarding just how intense the activity may become. There is a risk that auroral activity may reach high levels at high latitudes with an associated moderate southward expansion of the auroral zone. This, however, is currently only speculation. Models currently suggest that activity will remain mostly below magnetic storm levels with only sporatic bursts of minor storming, particularly at high latitudes. The auroral activity therefore, will likely remain at predominantly moderate levels at mid and high latitudes. Low latitudes will likely not be able to witness any of this auroral activity. If this should change, however, an appropriate auroral alert will be posted.

Lunar phase will begin interfering with attempts to view auroral activity in the late evening/early morning hours of 06 through 09 November. However, there should be a fairly good observing window between evening twilight and before the moon rises.

Radio propagation conditions will remain at normal to above normal levels until the impulse of activity from the recurrent solar region begins to impact with the earth near 06-07 November. At that time, propagation conditions are expected to become degraded over almost all latitudes. Middle and high latitudes will be affected most severely, with increased fading and periods of moderate to strong auroral-induced signal flutter. Low latitudes may also experience signal flutter accompanied with decreased signal stability and increased noise. Propagation is expected to be worst on the evenings between near 06 to 08 November. Conditions should then begin a fairly rapid recovery at middle and low latitudes, while high latitudes may take a day or two longer to recover to near normal propagation conditions.

NOTE:
The first M-class flare since 22 October erupted off of the sun at 17:41 UT on 04 November. Region 6350 (S25E25) has grown rapidly over the past 24 hours, from a size of 150 million square kilometers, to a size of 360 million square kilometers. Numerous subflaring has been observed from this region over the past 24 hours. Interaction between this region and Region 6347 (S19E11) probably assisted in producing this flare. The flare itself was rated a class M2.1/1B Tenflare with accompanying rich bursts of radio emissions. The flare was located at S21E15 and lasted 18 minutes. 245 MHz radio measurements indicate that this flare produced an emission of 11,000 s.f.u. (solar flux units) at 245 MHz. Overall sunspot numbers have increased quite substantially over the past 24 hours, from 170 on 03 November to 227 on 04 November. Surging continues to be observed on the northeast and southeast limb, indicating that the active solar longitudes are indeed rotating back into view.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 04 NOVEMBER

|-------------------|--------|--------|--------|-----|------------|
| Geomagnetic Field | Thu. | Fri. | Sat. | Sun.| Anomaly |
| Conditions | Given in 3-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (04 NOVEMBER - 13 NOVEMBER)

| Geomagnetic Field |Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun|Mon|Tue| Anomaly |
| Conditions | Given in 8-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near
the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral
activity most visible above the northern horizon for
mid to high latitudes. This type of activity usually
encompasses torch-like (or beam-like) aurorae mixed
with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating
curtain aurorae possibly mixed with moderate intensity
zenith aurorae. Can occur to the north as well as
stretching up near the zenith, particularly at middle
latitudes. There may be some color fluctuations
discernable.

VERY HIGH: Very active, very bright and very colorful auroral
activity possibly mixed with intense zenith and
curtain aurorae. Visibly strong pulsations with
auroral boundaries to the zenith, stretching even
partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with
rapid color and brightness fluctuations mixed with
very strong rapid auroral pulsations visible
throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

>If I modified my IC-745 to transmit on 11 meters (CB band) and kept
>the power down to 4 watts out, could I legally use it to transmit on
>that band?

No. Your IC-745 as modified is not type-accepted for the CB service.

>I don't ever intend on doing this, but I was just curious.

Usually the "type-accepted" thing is what gets about every radio
modification for some other service besides amateur radio. It sure
would be nice if we could transmit legally on CB or other services
that we could otherwise transmit on (e.g. if licensed as appropriate)
with the same one radio we have.

It would almost surely have to be type-accepted for all the intended
services, and I don't think the amateur equipment manufacturers are
wanting to do that. I don't think most hams want to pay the extra
cost. Besides that, it would be a tempting thing for a CB'er to buy
because of the likelihood of a modification to get full 100 watts (or
whatever) power on 11 meters. That would end up putting a ham rig in
the hands of a CB'er that would not otherwise buy one (w/o 11 meters).

We know what happens in the ionosphere. We DON'T know what conditions will get set up at any time in the future. It is as hard to predict as the weather.

But, yes, the observation of current propogation conditions is something that people can enjoy, just like the weather.

But do you limit yourself just to HF?

There was controversy on the audible effects of using a slow 44.1 kHz
sampling rate. I can actually hear the quantization effects so for me
it is no controversy.

Whenever you compress data, you run the risk that some combinations
of data will take MORE bits after compression. For audio, there are
a LOT of digital stream values that make no particular sense, such
as nearly full extremes of values between each sample.

There is a lot of possibility to compress audio, but they do need to
be prepared to dynamically expand that bandwidth in some cases where
less than optimal compression takes place.

With a bandwidth that dynamically is used in varying amounts, there is
extra capacity that could be used on an "as available" basis (and usually
there will be some available) non-audio digital service of some kind.

Hello!

I'm looking for a good public domain program for HF Propagation Prediction.
Such programs running on Unix and Atari ST would be of most use. I have
access to anonymous FTP if required.

I also need a program whose input data can be derived easily - is there a good
and regular source of such data on the Internet ?

73 & Thanks in advance,

Mike

No. Citizen's Band (Children's Band) radios must be type accepted
just like Business Band radios. While ham radios probably exceed
the requirements, they are generally not type accepted.

If the patch is part of the repeater itself, the FCC rules allow it to
be under the same automatic control as the repeater itself.

If the patch is not part of a repeater, and is under remote control, then
the controlling link must be not just on another frequency, but must be
on an AUXILIARY frequency. And you all know what those are.

Congrats to the gentleman on his favorable ruling. I read the opinion
and it looks like the plaintiff presented a masterful case. I was also
under the impression that the city probably should get a new lawyer :-).
He blew some basic legal questions in a big way. I'm not even a lawyer
(although I read a lot of legal stuff, it's interesting) and I
understood a lot of why the hams are winning this one.

PRB-1 seems to be holding up well. Keep up the good fight!

2749. Foreign Phrase Book for Hams?

Newsgroup: rec.ham-radio
Date: 1990-11-05 13:45:48 UTC
From: Warren_Tuiskula@es.UUCP
Message-ID: <9011050845.C70C0D01EDBF@es.office>
Source record: 6958

Does anyone have information on where I can obtain a copy of the foreign language phrase book for hams that was written by a Finnish amateur? This book was advertised in QST within the past couple of years. It contains phrases commonly used in QSOs in a number of languages - English, French, German, Finnish, Swedish, etc.

Either new or used is acceptable.

73,
Warren KA1JL

If you take it to the FCC lab and get it type accepted, yes.

This still does not answer my question. Yes, there are great minds that have entered the hobby through a no-code license, but what does that have to do with the goal of an increase in ham participation? This also does not say anything about what percentage of these people would have not joined the hobby if there were not a no-code license.

This still says nothing about the "market survey" I mentioned in my original posting.

2753. DAB and all that ...

Newsgroup: rec.ham-radio
Date: 1990-11-05 14:30:25 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9011051430.AA19141@cmr.ncsl.nist.gov>
Source record: 6962

I think that most of the proposed DAB (digital audio broadcasting) schemes being proposed envision something like a dozen "stations" sharing a single transmitter. Time-division multiplexing is proposed, and a bit of fancy compression is claimed. I suppose that the substantial number of "stations" puts statistics on your side in the matter of bit rate MOST of the time.

Phil Howard complains about the 44 kHz sampling rate of CDs. Phil, do you ever listen to National Public Radio or ABC radio, etc. They sample at 32 kHz, and compress each 1-millisecond block to 11 or 12 bits. Do you hear artivacts from this?

(artifacts..)

|> a branch with a rope?

It's a cinch loop that goes around the trunk of the tree. You push it
up, pull to cinch it (pulling/helping yourself up), cinch with your
legs
around the trunk, push the cinch loop up......It's really a safety
climbing aid - it does entail some physical effort - more than a
climbing
tree stand, but then it doesn't tear up you trees either.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2757. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-11-05 15:10:17 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9011051510.AA28371@blackbird.afit.af.mil>
Source record: 6966

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

>
>I am especially puzzled with the concept of "open" and "closed"
>repeaters and how the latter fits in the picture of amateur radio. Can
>someone please clarify this terminology for me?
Open means all users are welcome. Closed means 'members only'
in the case of a club supported machine and 'me and my friends
only' in the case of a machine owned by an individual.

Access to closed repeaters is often limited via the use of
CTCSS (PL) tones and sometimes other signalling systems.
Because of this, CTCSS gets confused with the notion of
a closed machine. Many open repeaters use CTCSS to reduce
interference.
>
>As far as I understand it, there are a multitude of "private"
>repeaters. What's the point in having a dozen repeaters in a
>questionable QTH (and limited range) in comparison to ONE good
>repeater in a high (broadcast) tower or similar? Or ARE they actually
>all that good?
Capacity. A dozen repeaters with more local coverage may
support a dozen short range QSOs while the one wide coverage
repeater would occupy the frequency in the entire geographical
area while carrying only 1 QSO. Obviously, the number of
radio amateurs on the air in a particular geographical area
comes into play here.

Many areas of US now recognize the need for a mixture of local
repeaters and wide area repeaters. Users are encouraged to
use the local machines unless they really need the range
of the wide area machine.

>
>What would you say is an average working range of a typical repeater

> In response to a thread involving having the ARRL become more active in
> lobbying Congress, etc., Jon Bloom said that in Newington it was considerated
> an "inappropriate use of funds" to lobby.

That is _not_ what I said. Please quote me accurately or not at all.
I said that ARRL devotes a relatively small amount to lobbying principally because only a small amount is _needed_. Again, not much legislation has a direct impact on ham radio. Regulation does, so that's where we expend most of our time and efforts.

> One reason given was that there are more effective ways to spend money to
> accomplish our goals. I fail to see how you could be more effective in
> influencing the course of legislation than to spend it WHERE legislation is
> written and enacted in the education of those BY WHOM the legislation is
> enacted.

True, if legislation were the most important problem. I think you fail to understand how the Federal government really works. See above.

> Another reason given was that by lobbying we marked ourselves as being not
> nice people. I guess that means we would become somewhat akin to the slimey
> creatures greasing palms under the table to get government contracts to build
> widgets. I know we all joke about Congressmen, but they're not THAT stupid!

Again, not what I said. There _is_ a difference between economic interests and non-economic public interests such as ham radio. It has nothing to do with being "nice," and I never implied it did.

[flaming deleted]

> So, since the ARRL won't, we must. There's an election Tuesday. Everyone

> study.

It's a free country, Jim, so go right ahead. I'm betting that working the system's levers from the inside will be more effective than calling your Congessperson and convincing him/her that all hams are nuts.

|>
|> Ken - WB0QNA
```

It makes sense for a 1/4 wave magnetic antenna to work like a 1/4 wave electric one. But 4 meters isn't exactly "1/4 wave"! I don't remember if theoretic efficiency goes proportional to size or proportional to the square (which would give you either the claimed 1.5 S units or twice that). In any case, small antennas have low impedance and consequently high resistive losses, which are going to make things look worse than theoretical efficiencies.

Then again, flat dwellers may have no choice. Any antenna is better than no antenna...

I can see it all now Jerry, the same bleeding hearts will tell us how we are makeing them LEARN 'all that technical stuff' (after the code requirement is dropped) that they will never use, so we ought to drop the technical test, since all the new folks want to do is operate appliances eh? After all we wouldn't want to FORCE anyone to go out of their way and have to learn a skill that they may never use.

>
> Well, it *was* a phone, not a CW contest... :-)
>
> jim

I will be operating N2RM during the CQWW CW section. It appears that we are going to be successful in putting together the same team (and with others now wishing to join the fun). I do NOT wish my name or call to be used against the NOCODE license. It was I who made the motion to the AMSAT board of directors and Phil Karn who seconded and pushed TAPR via the good offices of Andy Freeborn, then president, to come out publicly FOR a nocode license. This public position by two prominent organizations, in an open letter to the ARRL, was somewhat influential :-) in having them form the Wilson `No-code' committee. I am quite proud of the role we played and I am extremely proud of the work that my friend Phil has done. I'm proud to be his friend.

While I do truly enjoy operating CW, while I will be running one hell of a key at N2RM, and while I operated K2UYH during EME contest exclusively on CW out of necessity (I used DSP to get NARROW!!!! non ringing filters), I would like to say that I do not wish to keep some very good people from helping me on satellites, EME, weak signal VHF work, and more and who see no need for Morse to do this, from having a ham license. I would like everyone who enjoys operating CW, such as myself, to be able to do so. I would also like a class of non Morse using hams to be put together and it appears my wish will soon be granted. Since it appears to me that this is a fait d'accompli, may we now move this discussion on towards how best to bring these people out of the ghetto and into the mainstream?

His analogy not mine. The point is minimum requirements at universities or whatever produce a well rounded background i.e. exposure to what else is out there besides ones own myopic view of the world.
In addition, describing the CW requirement as "criminal and immoral" is just a bit much even for "no-coders".

2765. Re: BEAM magazine?

Newsgroup: rec.ham-radio
Date: 1990-11-05 17:05:58 UTC
From: kenw@col.hp.com
Message-ID: <27080022@col.hp.com>
Source record: 6975

This magazine was "introduced" at the IEEE-EMC Symposium in Wash. D.C. last August at the amateur radio luncheon there. I had a chance to speak with the publisher. The magazine seems legit, but only time will tell how long it will last (or whether the price will remain "Free"). I gathered from the questions the publisher asked, that the real reason for the question-aire was to assess the market for this magazine and to focus the articles to meet the needs of the potential readership. I also gathered that one of the underlying reasons for the magazine might be as a technical replacement for HR magazine. Again, only time will tell. The publisher was also actively soliciting authors.

I sent in my questionaire, but havn't yet received issue number 2.

2766. J-pole on other bands than 2M or 6M ??

Newsgroup: rec.ham-radio
Date: 1990-11-05 17:35:01 UTC
From: tomb@hplsla.HP.COM
Message-ID: <5720083@hplsla.HP.COM>
Source record: 6976

Has anyone out there tried, or heard of anyone trying, a J-pole on other than 2 or 6 meters? In particular, I'm thinking about 15 and 20 meters... as a way of avoiding radials.. And I'm thinking of it as an element in a phased array...

2767. DXCC Country List

Newsgroup: rec.ham-radio
Date: 1990-11-05 17:55:04 UTC
From: wmb@ulysses.att.com
Message-ID: <13984@ulysses.att.com>
Source record: 6777

The current ARRL DXCC country list follows. Changes from the
previous posting (3/90) include the deletion of Y2, 4W and 7O,
the addition of the new 7O, and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s)
10. other amateur prefixes

Please mail corrections and suggestions to me.

Regarding the compression of present-day satellite digital audio:

The 15-bit-resolution raw encoded data is compressed to 11- or 12-bit
RESOLUTION in 1 millisecond blocks. A scale factor is sent for each block.
24 or 25 audio channels fully occupy one satellite transponder, instead of
a TV channel.

He obviously never took it. I understand why the FCC wanted to cut costs by not giving the tests themselves and I know that most VE's are honest, but it is obvious from a lot of independent indicators that there are an AWFUL lot of dishonestly obtained ham licenses on the books.

Three or four years ago on the Compu$erve sailing forum I ran across some ocean yacht racers who were conversing about buying their ham licenses from the VE belonging to the yacht club sponsoring a certain race. It was obvious from the their remarks that they genuinely did not know that that was not the normal way ALL hams get their licenses. To them it was like car tags. You buy the radio, pay the fee, and receive your tags.

It's entirely possible they never learned otherwise. They never QSO'ed anyone but other people involved in the races they were in and more than likely never read the regs, ham magazines, or anything else that would have given them the clue.

There are others who DO know it's illegal, but don't consider it any more serious than driving 75 mph on the Interstate. If you say otherwise to them, they laugh at you.

And then there are those in BOTH the sailing and ballooning worlds who genuinely believe (or claim to anyway) that their hobbies are inherently so dangerous that even under normal conditions they are qualified under CommAct section 303 (or whatever the emergency clause is) to use any frequency they want to, with or without a license.

It's a strange world, Charlie Brown.

2770. Antenna questions

Newsgroup: rec.ham-radio
Date: 1990-11-05 19:34:31 UTC
From: wejones@CRDEC7.APGEA.ARMY.MIL
Message-ID: <9011051434.aa14654@crdec7.apgea.army.mil>
Source record: 6780

Antenna questions.

To receive wefax images from NOAA satellites, I had been using a Radioshack Discone antenna, but experienced periodic fade-in / fade-out problems, which I assume is due to rotation of the satellite or a circularly polarized antenna on the satellite. To fix this problem, I built a "Lindenblad" antenna following the directions in the ARRL Satellite Experimenters Handbook. This antenna (which is four folded dipoles arranged in a square, and then each tilted 30 deg out of the squares plane) works OK, but is made of bare 12 guage wire, so that when birds (the kind with wings) sit on it, they bend it all out of shape. My questions are:

1. What would I lose by making it out of heavier stock, such as 1/8 " or 1/4 " refrigeration tubing. I have noticed other posters refer to a rule of 1/1000 for element diameter/wavelength, and the 12 guage wire seems to be the maximum by this criteria. Most TV and other beam type antennas would violate this rule too, but they would probably make up for it via multiple elements.

2. What would I lose by supporting the wire over a plexiglas or wood form. The book specified bare wire.

3. What would I lose by using steel rods and making plain 1/2 wave dipoles instead of the folded dipoles. Some recent posters have been critical of the use of steel for transmitting, but since I'm only receiving, would it be OK?

4 How much am I losing at 137 MHz by using an antenna sized for 145 MHz? I was hoping to use it at both frequencies, and hoped it would be broadbanded enough not to lose much doing so.

5. Could my original fading problem (a very reproducible pattern) be caused by reflection from a nearby TV antenna? If so, how far away from such objects should I be?

6. What other antenna design might be useful? Is there an antenna design which is not ideal for transmitting (and thus left out of antenna books) which may be useful for receiving? I was looking for an omnidirectional antenna, but I could compromise in this respect if the patterns weren't too narrow. I want to avoid having to track, however, if at all possible.

7. Somewhat off the subject, I have both an ICOM 7000 and a RS Pro-34 scanner. With the Pro-34, I can replace the normal antenna with a short length of bare wire, and the radio works fairly well, in

fact better than with the supplied antenna. On the other hand, when I first got my 7000, I tried it out with a short length of wire, and it didn't work at all! (ie stations coming in loud & clear on the Pro-34 could not even be heard at all on the 7000). I was convinced that the unit was defective until I hooked it up to the discone. I have seen others comment on "sensitivity problems" with the 7000, and suspect that they were experiencing something similar. Why should a cheap radio outperform a quality receiver with a poor antenna, but the reverse be true with a good (or at least better matched) antenna? I assume that for some reason the 7000 is more sensitive to mismatch, perhaps due to increased selectivity.

2771. Icom control program

I distributed a semi-beta-test Icom R7000 control program (in C++, with source) in the shortwave group. I neglected to see if anyone here wanted it. It's a 142kB *.uue file. If you want a copy send me e-mail. There will someday be a post-beta version that will be announced more widely so if you don't need it in the next month or two, just hold on and it'll reappear.

I agree with Fred about the unending flame wars over this and a few other subjects. I propose that we start a new group

rec.ham-radio.tech

This way we can leave the endless debates in rec.ham-radio (too bad, actually) and go to a group with some meaning. Having subscribed to this news group for 8 or so years, I have my doubts about getting an agreement to stop the diatribes. Every year we get a new batch of subscribers who don't know these debates have gone on never ending. Maybe, a group whose name is tech (for technical) would allow the rest of us to skip the low information content postings? Probably not, but maybe a smaller amount.

Regards, Dave

A little while ago, my wife favored me with a camcorder for my
birthday. It strikes me that now I have the major part of a fast scan
TV station. All that's left is the RF front end. Does anybody know
if there is any fast-scan activity in the SF Bay Area? What
frequencies are in use? Would modified broadcast TV components be
adequate? Or is more selectivity/sensitivity needed? Does amateur
FSTV use the same partially-suppressed-single-sideband video as
broadcast TV? If so, the little TV RF modulators used for video
games etc probably wouldn't work, right?

>bring these people out of the ghetto and into the mainstream?

(Minor grammar flame: It's _fait accompli_. Nyah. :-P)
Sadly, I think Bob's right: we will be stuck with a no-code license sometime in the near future. I further agree that these people should be accepted into the amateur community; they will be legally licensed amateur radio operators, after all, and that means "ham" to most of the world.

How we get them into the mainstream will depend on just what the FCC does. It will be more difficult to do so if their privileges are restricted than if they have access to a large portion of the spectrum.

Since we won't have the opportunity to educate the new no-code licensees in amateur operations before they're licensed, since they can get the ticket simply by memorizing a book, we must do so on the air when they get on. This means that we must first clean up our own act.

We must provide the infrastructure they'll need to operate successfully. This will vary widely, depending on what the FCC does, but it may well include building repeaters and packet networks on bands they don't exist on now. We will always be stuck with 1200 BPS AFSK on 2 meters, but this may be our opportunity to build the better network that the PSK types keep promising us on 220 or 440.

I haven't given it much though, since the idea is highly distasteful to me, but since the ham population has caved in to the FCC and gone along (for the most part) with the idea, let's see what we can salvage.

>it is no controversy.

If you are hearing quantization effects, it sounds more like not enough bits/sample than not enough samples/sec. (ingoring things like sigma delta converters where the distinction could get fuzzy).

Do you hear it more on quiet passages than loud ones? That 90-100 decibels of signal/noise ratio on a CD only holds on the loudest passages.

Non linear encoding, or maybe floating point representation would let you cut down the s/n ratio by a few tens of decibels, but have it hold over a wide dynamic range. This could sound better overall, and cut down the bit rate. Sort of a digital form of Dolby.

>Whenever you compress data, you run the risk that some combinations
>of data will take MORE bits after compression. For audio, there are
>a LOT of digital stream values that make no particular sense, such
>as nearly full extremes of values between each sample.

If a full slew between samples makes no sense, isn't that like saying that your sampling rate is higher than it needs to be?

2776. T33X

Newsgroup: rec.ham-radio
Date: 1990-11-05 21:23:48 UTC
From: sawyer@twg.com
Message-ID: <8219@gollum.twg.com>
Source record: 6786

Sunday there was an operation on claiming to be T33X, and I'd sure like to know if anybody has information about whether this one was legitimate. From my QTH it came at the right beam heading, but the fishy thing about this was that just while HK0TU was running a big pile-up at 21.025, the purported T33X came on 21.023 saying "up 1". The results were predictable--he put a pile-up right on top of HK0TU. I'm inclined to think this was just one of the more creative ways of jamming I've encountered recently. I know that SM7PKK et al are supposed to show up today as T33R and T33T, but I haven't heard anything about a T33X operation. Any info would be appreciated.

Not so fast with the sarcasm there! This ad says that their antenna is down
9 dB from a beam. Phrased that way (instead of "only 1 to 1.5 S units down"),
it doesn't sound like such a hot deal. But it doesn't sound like you've got
grounds for a truth-in-advertising challenge either.

+Ham Of The Future.

Ok...given that the minimum list of requirements would include an interest in communications and a series of skills for participation, I would suppose that this hobby might have room in it for a wide variety of people.

1) People that would like to simply communicate, and perhaps participate in the contest aspects of the hobby. Their forte is OPERATING PRACTICE, finely honed and polished. They collect QSLs and chase the rare ones, using mostly commercial equipment. Contests could be devised to give the person without an exotic station a competitive chance. Then there could be contests that cater to the "big guns"...special modes, etc. Always keeping in mind that there must be a means of factoring in the international band rules. For example: The contest is PHONE, the bands are 10-15 & 20, but HAMS with a casual interest might participate, even though they be AMERICAN NOVICES, since they can only work CW in the 21.1-21.2 and CW or digital on 28.1-28.3. ..given a multiplier, there would be some real interest in working these people via cross-mode! These kinds of things build interest and garner a wider participation.

2) People that like to build and enhance the design of existing equipment. Their bread n butter is the technical savy that has always been a part of Amateur Radio. These skills will be sharply challenged by the newer and still emerging materials and component sciences. Lots of cross-level intersts in space and digital applications. This segment of the Amateur community might even begin a series of trainning programs that build the skill levels and recognize demonstratible talent in design much like the CW fans today have their 25-30-35-40 WPM proficiency certificates. Trainning after licensing,

to become even better at the game of electronics and communications! Look for advanced science & circuit kits to be a part of all this, perhaps a DIY custom chip kit or an advanced CAD using A.I. and RDBMS to provide the ham with a unique opportunity to design circuits, in real-time and watch what happens in that circuit by simulation...computers are bound to be a big part of what this crowd does, there might even be some new turf discovered by hams as the number of people interested in computer-level communications increases. Spread-spectrum technology applied to reduce QRM and band congestion!

There might be a chance that the Amateur community will combine digital networking, DSP and cellular technologies to provide a "virtual shack" accessable by any Amateur with a minimum of local equipment; perhaps a series of clubs or the ARRL will come up with a "virtual shack protocol" and related hardware specifications to match. Thus a ham with just a 220MHz ht could access a local intertie cell and then a DSP-based network such that 40 meter operations, in any geographic area served could commence! Given greater local resources, a complete ATV station for example, QSOs with other stations in other areas served by the system could provide long distance QSOs for modes that are normally local! Store and forward technology might be employed in this scheme to permit greater flexibility. Eventually, Amateurs might carry an advanced form of the HT, sort of a pocket computer and communicator rolled into one. It would have up and down link capability for network access, DSP for voice, picture and digital modes, touch-tone to access the telephone system and a keyboard similar to that of a court-reporter...all in a small package that could be clipped on a belt or carried in a pocket!

For the operator that is far away from such networks, advanced radios will be different in that the "shack" will probably only contain the control console, and this may be virtual! A plug for the mic, the TV camera, perhaps a hi-speed data line and the console speaker(s). At the other end of a series of light fiber connections will be the actual "rig". It will contain a small microprocessor-based comm system, an advanced DSP/TNC box, a set of common AF/IF/RF stages and then a series of band modules with related bi-linear amplifiers. The remoted combined "rig" will be located near the antennas, perhaps some parts will be firther remoted to AN antenna or combination of antennas in an array.

The operator might elect to have a local link to his shack, using one of the advanced pocket communicators, so that he is free to roam the property much as we do today with voice using our computers and a local remote frequency; ala 'Shackmaster' and 220MHz. Thus, where the big networks do not exist, the Amateur will erect a local net, in time these might be the expansion-base for interconnecting to a nearby node of a larger net. This sharing of resources is pointed to by the large, open repeater network and the growing network of packet nodes on 2 meters and other bands.

+
+What does this person know? What skills and attitudes would such an
+individual have? Pretend you can, in your dreams, make Amateur Radio

+in the Twenty First Century what you would like it to be.
+

This person will know a great deal more (on average) than the majority of Amateurs today. It will be necessary because of the increasing technology and the increased use of networking. Some pockets of resistance will build small cliques of 'old-timers', content to operate and maintain antique gear and much as today we will all point at the fierce independence of thought that typifies the Ham community! Eventually even the best of gear becomes obsolete, or is darn-near impossible to fix, find-parts-for, or Mickey Mouse into working. Some gear winds up trashed because the spectral output is no longer considered "GOOD"...this is how the older equipment will most likely wind up. It's possible though, that with the skills that some people have, that we may be hearing operators using equipment from the 1940's and up that has been re-engineered to newer specs. These will be some interesting projects for the hams that enjoy the tech side of it all.

+How should the public and the government view the Amateur Radio Service?
+What value does it provide, or in essence, WHY does Amateur Radio exist
+in the year 2001?
+

The public service side of the equation will continue to showcase the responsive nature of Amateur radio. In times of disaster, public means of communication drop dead. The telephones and radios used by Joe Public although very reliable cannot handle the traffic that emergency situations generate. Earthquakes, floods and the like continue to prove this again and again. On the world scene, Amateur communications are sometimes the only means by which news of events can be relayed, especially in cases involving massive civil insurestions and war.

The government will undoubtedly gauge the usefulness of Amateur radio by the leaps in communication art that we provide, plus our educational values. In that there is an increasing need to interest young people in technical careers, and to provide healthy alternatives to 'hanging-out', Amateur radio can provide opportunities to our youth that cannot be found elsewhere...if the existing ranks are willing to grow and change!

Here's the catch: If the ranks don't grow, and the frequencies lie dormant we may very well see the governments reducing or eliminating our allocations! I favor a restructuring of the licenses. The elimination of CW skills above 5 WPM for General-Advanced & Extra. If people honestly desire to communicate at higher speeds in that mode, special subbands can be established exactly for such purposes. Endorsements are another option. The no-code license is clearly the license of the future, because most people don't care about CW, any more than they care about using a Spark-Gap transmitter!

Far off in the future is the lure of space travel, of industrialization off-planet and the like. Communications plays a valuable part in all these endevours. Persons with skills in communications, in the technical phases of communication science will find their talents highly sought after. Much as the government welcomed Amateurs in times of war, to be the experts in

communications, so in times of peace and expansion of humanity into space
the governments will again turn to the Amateur ranks to find those persons
active and interested in the art of communications. We are a valuable part
of any future that we can visualize.

One way to make a twinead J-pole with greater mechanical strength is to slip the sucker inside a 6 ft piece of of PVC pipe and seal the ends.

This has nothing to do with Ham Radio, but since it was posted on the net ...

In English, the pronouns used to denote either male or female are "his" and "him". Yes, this is the same pronoun used to denote male. This is not sexist; it is simply the way the language's grammar works. To use the language correctly, you must use "his" and "him" for singular pronouns, not "he/she", "him/her", or "na".

Unfortunately, because of this lack of a neuter pronoun, most people make grammatical errors such as:

Everyone should get their ham radio license.

"Their" is plural and "everyone" is singular, so this is an error. Some well-intentioned feminist-types do this:

Everyone should get his/her ham radio license.

This is distracting for written English, and even worse for spoken English. (What should one say? "HIM SLASH HER", "HIS OR HER", or what?) Try reading a document that contains a lot of "his/her"s, and you will see what I mean. The author of the previous article talked about this:

Everyone should get na ham radio license.

Huh? That would sure take getting used to, all right. No, sorry, the only acceptable form is:

Everyone should get his ham radio license.

Like I say, no sexism is intended. I really believe that feminists could further their cause a lot better by spending time and energy on issues that really affect women, like day care, pre-natal care, equal pay for equal work, etc. Changing the English language would do nothing to help anyone.

+---------------
| Now here's something you can flame me for...I think the no-code attitude is
| selfish and arrogant. You want to change ham radio in ways that I think will
| destroy it.
+---------------

My desire to change ham radio in ways you think MIGHT be harmful is "selfish and arrogant", but your desire to keep it a closed clique of spark-gap worshippers is open and forward-looking?

PuhLEEEZE. I'm over here, a mere Technician, but working on integrating TCP/IP into the local packet network to improve packet for everyone including straight AX.25 users, and on getting young blood into the hobby, and you call me selfish and arrogant for wanting to remove an antiquated communication mode from the entry requirements. Of course, my efforts don't count because I don't do it all in CW at 35wpm, so I'm not a "real" ham, just a glorified CB'er. (heavy sarcasm off)

So what have *you* done to help us keep what remains of 220MHz lately, anyway?

+---------------
| You may have the best of intentions, but I don't think you know
| and understand what has kept the hobby alive for the past fifty years. The
| deterioration of good operating procedures we all now hear on the bands is a
| direct result of the loss of the sense of fraternity and tradition that I still
| hear on CW.
+---------------

Funny, but the only place I hear lots of "in-your-face", as you put it later in your manifesto, is on HF. Including carrier-sweeping when I got my good HF rig back early and tuned in the Sweepstakes. Note that I'm talking about the *CW* contest! So much for "good behavior". The local folks on 2m, 220MHz (remember that? Once upon a time, it was a ham band), and 440MHz, both FM and packet, are by and large good folks who are willing to lend a hand to others and still know good behavior. It almost makes me thing that we should just leave HF to the CB'ers and suchlike and concentrate on the bands where one still finds common courtesy.

Luckily for you, I don't advocate such a course. And I *do* use CW. But I see no reason to force it down people's throats, just as I don't force packet down everyone's throats.

Somehow, I have trouble swallowing the argument that 5 WPM code keeps the brightest minds out of Radio. A truly disciplined mind will recognize the CW requirement for what it is ("an interesting, but irrelevant baseband modulation example"), spend the 6 hours or whatever learning it, and then get on with being brilliant.

If the HF Olde Phartes want to be masochistic, let them. You don't need 13 or 20 CW for getting the bands needed for some cutting-edge work.

My personal opinion is that Hams haven't worked hard enough at promoting what the Amateur Service provides to the brilliant minds - a personal playground at real power levels and bandwidths. We have not shown how computers can "marry" radio, with interesting results.

Besides, computer hackers can make more money in their spare time by hacking computers than by using _Amateur_ (read "non-profit") Radio.

You can make -9 from +13.8 by using an inverter. If the current requirements are not too much, it can be done with a PWM chip and a couple capacitors. Look in some of the power chip catalogs from TI/National/...

You see the forest, but miss the gopher holes. :-)

I passed my test last June and I assure you that right now I, an active ham operator, do not know the CW modulation method. Or more precisely, I don't know Morse code well enough to make any practical use of it. So my taking the code test was only valuable (to me or anyone else) in one way: it enabled me to be licensed.

That sounds cynical, so let me be clear, I'm not *proud* of not knowing it any more, or anything like that. I just don't find it necessary or useful to know it. So naturally it has slipped away.

> As I recall it came from CQ or QST. It was a wide-spaced folded "dipole"
> with a load resistor. THanks for any useful information and esp. for
> specs.
> Grover Zinn
> ex-W5vyu

I went to my collection of old CQ magazines, and found some of the original articles by G.L. Countryman, W3HH.

Basically it is a sloping folded dipole with a terminating resistor opposite the center feedpoint. You can think of it as a squashed rhombic turned on end. It is non-directional and operates over a 5;1 frequency range.

The original article is in QST, June 1949. There were several follow-up articles in CQ, and I found some in November 1951 CQ and February 1953 CQ.

The length from end-to-end in feet is 328/MHz for the lowest frequency. Of course, the total wire length is twice this.

The spacing between the wires is 9.84/MHz for the lowest frequency.

The sloping angle should be about 30 degrees.

The terminating resistor should be non-inductive, and have a rating equal to 35% of the transmitter power. It should be slightly higher in value than the impedance of the line in ohms. The author recommends 650 ohms for 600 ohm feeders, 500 ohms for 450 ohm line, and 390 ohms for 300 ohm line. Instead of a resistor, you can use a shorted parallel line of resistance wire (!) running away from the antenna.

It is fed with 600 ohm balanced line.

It is called the T2FD, or "Tilted Terminated Folded Dipole".

I think Bill Orr may have written about it a few years ago in his column in Ham Radio Magazine.

Has anyone used this antenna? They sure raved about it in the 1950s. I wonder if that B&W broadband antenna that is fed against ground at one end, and is terminated against ground at the other, may be electrically similar?

Also, I wonder if a Zepp (non-resonant dipole) with balanced feeders and a tuner might have just as much bandwidth, but without the loss

of the terminating resistor?

When this article was written, 600 ohm balanced outputs were common in ham gear, and they didn't operate over wide impedance ranges like the antenna tuners that we use today, so this might explain why this antenna was so popular.

>>What would you say is an average working range of a typical repeater
>>in Ohio, or any other place with flat terrain?

> It's been a while since I lived in the flatlands, but I would guess
> about 30 miles radius.

With a mixture of local and wide area, the range is often just as
varied. Wide area repeaters also often, but not always, extend their
range with extra receive sites, or linking with other repeaters.

From my parents home, I can hit a Columbus Ohio machine via its
Portsmouth receiver 45 miles away.

Repeaters such as the 145.250 machine in Indianapolis have quite
a range of over 100 miles. There are extra receivers but only one
transmitter on the one frequency. It also has a couple of links to
other repeaters on other frequencies. Owned by WA8VZY.

Re: Sweepstakes. There seemed to be lots and lots of cw in the
RTTY and AMTOR segments. I realize that 14.070 to 14.090 (and similar
segments in the 15m and 10m bands) are for the digital modes only by
"gentlemen's agreement" (sorry about gender insensitivity). I know that
by the letter of FCC LAW cw can be sent anywhere on the band. But I think
that it would be nice for all concerned if people would observe the various
"mode segments" of the bands. Otherwise, why should I stay confined to such a
small 10kHz (AMTOR) segment? Why can't I send AMTOR and/or Baudot RTTY down
at 14.025-14.070? I would like to do that a lot.
Any comments from the cw fans?
It seems to me what's good for the goose.....
Cheers,
Don

Please send the actual keplerians, since I believe they are of greater
value to the amateur radio society than the 2-line format description.
Why has the posting of keplerians lately ceased? A couple of months
ago we still received regular postings...

Keep up the good work, continue posting !

Argh! Come ON! 5 words per minute is so ridiculously easy to learn...

America is suffering a decline because too many people are getting
fat and lazy. It is really no big deal to learn 5 WPM CW. Instead
of learning it over the course of a few evenings, however, too many
people spend all kinds of energy trying to lower the standards.

I say "More is not necessarilly better." Lowering standards that are
already low is no solution, unless you LIKE Citizens Band.

Message-ID: <32700003@hpcuha.cup.hp.com>
Source record: 6810

I just got a very nice Hallicrafters
SX-16. It's complete and probably
working. It is fairly dirty inside.
The lettering on the outside is kinda
brown looking.

I have a couple of questions for
you collectors out there.

1. I'm assuming that the lettering
should be white. Am I correct?

2. What should the finish look like
on the inside chassis and the transformers, etc.?

3. Whats a quick way to clean the metal
surfaces inside the cabinet?

Thanks,

Jim Allen

I don't know about T33X, but last night (Monday, 5 OCT) at 0018Z T33WV was on 10 meters at 28.495 running simplex. He said his QSL route was his home call of DK2WV.

Also on 10 meters was C21NI on 28.485 at 0000Z first running split up 5 then later on running simplex. This is Kiyoko and she is doing the same fine effort here as on ZK1, ZK2, ZK3, and any others I may have missed.

I can copy well in the 20-22 wpm range for QSO's and was able to handle the contest exchange in the 25 wpm range. Some of the operators slowed down to my calling speed with out my asking, others put up with my requests for repeats and a couple real fast ones responded to my QRS with out a comment and gave me the QSO. I did notice that when some of the real fast fellas slowed down they got a series of calls, but soon as they increased there speed the calls slowed down. If a given operator is too fast, try QRS, many will respond at a slower speed that matches your sending speed. Key point - send at a speed you can receive! Don't feel bad, this was my first real serious attempt in a CW contest and I just bearly made my PIN.

I don't think a machine is a practical way to copy code during the contest. I did however feel that a number of operators were using CT or NA for logging and replies. The 4-5 sec delay after I called before they came back seemed like my call was being checked in the computer. I really don't see a problem with using the computer or a memory keyer for the replies, except it tends to increase the operating speeds. Certainly for the logging chores, a computer is the ONLY way to go.

2803. Questions, questions, questions

Newsgroup: rec.ham-radio
Date: 1990-11-06 17:07:38 UTC
From: root@w8grt.fidonet.org
Message-ID: <310.273701E0@w8grt.fidonet.org>
Source record: 6813
Cross-posted to: rec.ham-radio.packet,rec.ham-radio

I wish to ask a fundamental question. Why are there so many questions on this newsgroup (and the Fidonet HAM and PACKET echoes) on "How do I plug in the power cord?" or "Why isn't the documentation more specific on whether the machine screws tighten clockwise or counter clockwise?"

When I was a baby ham, almost the only documentation was the circuit diagram. We studied that. Maybe poked around "The Handbook", and then tried it. If it smoked, plunged the whole block into darkness, or made the cat's tail stand up straight, we knew we were headed in the wrong direction. If some Old Fart said, "There's a lid tuning up on the frequency", we knew it was "getting out".

Come on, guys, take a chance. Live a little.

>

Alan, the unfortunate thing is that it is required by international agreement for work on the HF bands. However, what is NOT required by that agreement is speed above 5 wpm. Since we HAVE to have code for HF, we should test ONLY at 5 wpm. If people think it would be nice to show greater proficiency than 5 wpm, let's roll that into the written exam process by adding questions to the written. I.e., let's add 5 code questions to the extra, increasing the questions asked to 55 and the passing score to 41. That way, if you fail the five code questions, you don't fail the test.

From: johnm@jetsun.weitek.COM
Message-ID: <950@jetsun.weitek.COM>
Source record: 6816

I have a housing site in the hills which affords the use of hill behind the site which is about 4-500 feet higher, which is also part of my land. I would like to place my antenna at the top of this hill. The horizontal distance is about 200 feet. The problem of course, is connecting the radio to the antenna. Cable sounds too expensive. Has anyone on the net had any experience or thoughts to relate on this problem (radio links, remote transmitters, etc ?). Thanks in advance.

- John

2807. VVV VVV VVV

Back in the old days, when us olde phartes had to take our tests at the FCC field office, my elmer gave me some advice on how to make the code test a little easier. I was going for my Advanced (13WPM) and he said, "Be sure to copy EVERYTHING, including the VVV VVV at the beginning of the test, because it counts toward the 1 perfect minute." I thought he was BSing me, but he was adamant. So, at the test, the FCC examiner starts the code machine, and sure enough, "VVV VVV VVV" was there! Nine characters out of 65 (13WPM x 5 char/word)! Already got 14% of the first perfect minute!!! YAHOOO!!!!!!!!!

Let me add my voice to what I hope is a choir of congratulations on your successful challenge. I'll be following this one closely to see if perhaps there is a court precedent you have won that I can use.

A little over a year ago I went through 3 planning commission hearings and a city council appeal on my application for a 65' tower. The circumstances were identical to yours. The city has a ordinance which is not in gross violation of PRB-1 (max height of 65' permitted with setbacks, etc.). Everything in my application was precisely consistent with the zoning ordinance, and I even have

a letter from the city planning director to that effect. HOWEVER, the planning department required a public hearing before they would grant a permit. Two neighbors complained. The finding was that:
- the zoning ordinance states that "conditions may be imposed upon the issuance of a building or use permit to mitigate the visual impact...";
- the planning commission, which was later upheld by the city council, interpreted this as "it is required that steps be taken to mitigate the visual impact";
- per the judgement of the planning commission and the city council, I had not taken adequate steps to mitigate the visual impact;
- therefore I was not in compliance, and the request was denied.

I could never get anybody to volunteer anything about what would be an adequate step to mitigate the visual impact. I offerred to put the antenna anywhere on my 1 acre lot they wanted, and even offerred to reduce the height requested. In the end, it was "make a specific proposal and we'll tell you if it passes". I made 3, and none did. Exactly the same as in the situation you just fought, it boiled down to the question of take years and many $K to fight it or just throw in the towell. I chose to fold and come back another day; you chose to put your money on the line. Your willingness to take a stand and risk your money will probably help me in my next attempt as well as every other ham who runs into local governments that want to ignore PRB-1 because they are banking on our unwillingness to fight it in court. If you'll post an address for people to send a contribution for your fight, I'd sure like to be the first to get my check there. Thanks for going to bat for all of us.

AA6KX

P.S. Did you ever try serious DXing/contesting with a 14' boom up 30'? It stinks.

I worked this guy on 10M CW about an hour before he showed up on 15M
es started QRMing the HK0TU operation. Given the fact that the signal
strength of the HK0 was not so hot in CA, presumably a few thousand miles
closer than Banaba Is., I'd be willing to believe he couldnt hear the HK0.
Though....he should have been able to get a sun-tan from all of the RF
from the pileup 5KC up ! So, maybe he had no excuse. Some DX'ers on the
KN6J DX packet node thought they knew his home call. DJ6??? if I recall.

< square (which would give you either the claimed 1.5 S units or twice that).
< In any case, small antennas have low impedance and consequently high
< resistive losses, which are going to make things look worse than theoretical
> efficiencies.

For small loop antennas, radiation resistance is proportional to the square of the loop area. This is proportional to the FOURTH POWER of the loop diameter.

For short dipoles, the radiation resistance is proportional to the SQUARE of the length. Short dipoles have higher radiation resistance than small loops of similar size (less than about .1 wavelength max dimension).

On the other hand, it's much easier to get a low-loss match to a loop since no loading coil is needed.

A minor bone to pick. Most of the hams I know, including myself, learned
CW using tapes and morse trainer programs, not off the air. My initial
education in ham radio came from buying a 2m ht while I was still waiting
for my ticket to arrive, and LISTENING. In any event, we're in agreement that
we'd better clean up the various messes up on the bands (2m, 20m come to mind).

I don't know if there oughta be a law, however, it would take the fun
out of it (for me) to use any kind of copying aid -- other than better
filters etc or another ham listening with you when multi-op. I worked
in the slow speed areas, and got the impression (from sending mistakes
and the like) that most others were operating 'manually'.

> In working my (puny) 99 contacts (one short of the pin :-(( ) I was forced

> and better but I've always thought there werent many.

I worked 93, so I know just how you feel! I was cruising along with 100
in sight Sunday afternoon, but the broadcast stations filled up the
slow-speed part of the band (my station good only on 40, although I got
a few on 15). I can copy 15 wpm (on a good day :) and had no problems
at all with others' speed in the slow-speed segments. Seemed like most
were less than 13 or would adjust to your calling/answering speed. I
would occasionally dip down into the high speed band and find a nice
signal that I could 'almost' copy, listen for a few rounds to get the
exchange and then call (at my puny straight key speed). Typically,
they would come back closer to my speed, and usually throw in an extra
TU or 73 (an 'A' for effort?). Anybody care to comment on whether the
CW cheetahs regard the turtles as another welcome contact or a nuisance
(assuming we've listened enough to have a good chance at completing the
exchange in one try)?

Only in one case could I not copy someone at all -- I answered their
weak (slow) call and could just not get any of the exchange. When I
asked for a "pse rpt all?" they came back with something different so
maybe they couldn't copy me either. I subsequently discovered I had
been operating for about an hour with RF gain backed off (short circuit
in the brain hi!). I had about three qso's with people that didn't
know a contest was going on (or didn't hear my SS).

> CW contests seem to be losing their charm and degenerating into a poor
> mans RTTY contest.

My first, so I really can't say. I hope not, because anyone that has a
CW copying aid can likely just go ahead and do RTTY (which I also hope
to do sometime).

> I wonder how many stations were using PK-232 etc for sending and/or
> receiving
>
> The ARRL had attempted to establish slow-speed segments for mere mortals
> such as me but there was a positive lack of activity in these segments in
> my part of the world.

Maybe you're in wrong state (:->). I stayed up late Sat. to catch
some 6's, but didn't hear many. However, this was when I had my RF
gain messed up! If it wasn't for that, I might have broke 100.

Seriously, maybe our expectations are just different. Seems to me that
you did pretty good for "first semi-serious attempt".

I thank the ARRL for thinking of us slow-speed coders. People tell me
that this is a new thing. If so, I hope there is enough response that
they do it again. I don't know if I'll ever be able to copy the big
guns!

> Thoughts, comments ????????
>
> Stu N6TTO

> be my last until I can copy 35 wpm !

My first too! I hope to be at the next.

Thanks for starting up this subject, and I hope more will come forth
with their SS experiences and opinions.

> for 300 ohm line.
>
> Lots of stuff deleted...

I built one of these about four years ago using the 390-ohm
terminating resistor and a 6:1 balun obtained from Palomar
Engineers so I could feed it with 50-ohm coax. The performance
was less than spectacular. The model I made was cut for 40
meters, so I expected it to work anywhere from 40 through 15
meters. The SWR was about 2.5 or 2.7 to 1 across all of 40
meters. It was worse on 20. It was actually quite broad on
15 meters, about 1.3 to 1 across the entire band.

I tried to "A-B" this versus the 40-meter dipole I had up at
the same height as the T2FD. The T2FD was consistently two
S-units below the 40-meter dipole. Since it had a very nice

SWR on 15 meters, I thought I'd compare it against the TA-33
that I had up at 40 feet. The T2FD was consistently 5-6 S-units
below the tribander.

I threw the T2FD out.

> would violate this rule too, but they would probably make up for
> it via multiple elements.

Breaking the 1/1000 rule will cause the optimum element lengths to vary
from the values calculated by the simplified equations in the handbooks.
Fatter elements will also be more broadbanded. Don't get too carried away
or the antenna will be squirrelly to tune. 1/100 should be safe.

>2. What would I lose by supporting the wire over a plexiglas or wood
> form. The book specified bare wire.

One of our locals made the whole thing out of TV twinlead stuffed into pieces of
PVC pipe. Seems to work fine for receive. PVC is lossey at these frequencies
so I wouldn't want to transmit through it.

>3. What would I lose by using steel rods and making plain 1/2 wave
> dipoles instead of the folded dipoles. Some recent posters have
> been critical of the use of steel for transmitting, but since
> I'm only receiving, would it be OK?

Steel has high resistance at RF frequencies. It would work, but would
not be ideal.

>4 How much am I losing at 137 MHz by using an antenna sized for
> 145 MHz? I was hoping to use it at both frequencies, and
> hoped it would be broadbanded enough not to lose much doing so.

This makes a significant difference. First, an antenna cuts off much more rapidly on the low side of center than the high side. Second, the phasing harness for the Lindenbad will be completely wrong so you don't get the desired circular polarization.

>5. Could my original fading problem (a very reproducible pattern) be
> caused by reflection from a nearby TV antenna? If so, how far
> away from such objects should I be?

Probably not. What you describe sounds like classic polarization fading. As a rule of thumb, an antenna should be at least 10 wavelengths away from another to avoid near field effects. Some people say 100 wavelengths, but I've found 10 a good compromise.

>6. What other antenna design might be useful? Is there an antenna
> design which is not ideal for transmitting (and thus left out of
> antenna books) which may be useful for receiving? I was looking
> for an omnidirectional antenna, but I could compromise in this
> respect if the patterns weren't too narrow. I want to avoid
> having to track, however, if at all possible.

The Lindenbad is probably the best nondirectional circular polarized antenna you can build. Concentrate on making it work right and you'll be happy.

>7. Somewhat off the subject, I have both an ICOM 7000 and a RS Pro-34

> (or at least better matched) antenna? I assume that for some
> reason the 7000 is more sensitive to mismatch, perhaps due to
> increased selectivity.

The R7000 is designed to match 50 ohms. It will not be happy with a short high impedance end fed wire. The Pro-34 is a typical high impedance design and works best with an end fed high impedance wire. When you attach the 34 to a good communications antenna matched to 50 ohms through 50 ohm coax, you grossly mismatch the radio and, except for the possible advantage of having an antenna high and in the clear, don't see an improvement. The R7000 however comes into it's own when properly matched.

Glad you saw it, Ken. I had you in mind when I posted it.

First, it orginates (Sure!) originates as a groupmail conference in a fidonet technology net. Groupmail is somewhat analogous to a moderated newsgroup. I was planning on gatewaying it into a mail list until and unless there are enough takers to warrant setting up a newsgroup.

Of course, if you have a Fidonet compatible mailer (FrontDoor, Binkleyterm, SEAdog, D'Bridge, etc., and GROUP.EXE, you can pick it up directly from the moderator.

I should comment that, for those who have not sent me their tapes,
it seems to me to be wiser to send them to the post office rather
than my home. I say this because I have received 2 tapes at the
house (maybe 3, I lose count), and both have been left in space
between the screen door and the back door at my townhouse complex.

The tapes are only marginally hidden there.

Fortunately, the dogs in the neighborhood do not wander around too
much, so damage from that sector will be minimal... :-)

Ah, well....

2830. The un-net this weekend!

Newsgroup: rec.ham-radio
Date: 1990-11-07 00:07:23 UTC
From: rusty@qip.UUCP
Message-ID: <5353@qip.UUCP>
Source record: 6840

Just to remind everyone about the un-net this weekend:

Remember that, "every weekend" "we" hold an un-net.

What's an un-net? And why did I quote "every weekend" and "we" above?
I'm glad you asked! :-)

The Un-Net is a time, 2 frequencies, and a lot of fun. It is not a
net, given the characteristics of 10m prop. What you do to join it
is to get on one of the 2 frequencies (or as close as you can get)
and call something like "cq usenet". See if you can find any other
usenetters to talk to. (I've managed at least 6 or 7 so far) Keep
it up for as long as you want, but the "major time" range is, as you
can see from my .sig file below, 1700 UTC till 1900 UTC.

Ok, now, why did I quote "every weekend"? Because not everybody gets
on every weekend.

And why did I quote "we"? Because I doubt that many people get on
very regularly. I will finally be active during the un-net this
Saturday (the 10th), having been inactive for about the last 3 or 4
months...

SO, I look forward to "seeing" you this Saturday!

RAPID RATE. AS OF SUNDAY NIGHT THE FLUX HAD REACHED 220, TEN POINTS
ABOVE THE SEPTEMBER PEAK. COMBINED WITH THE EXPECTED IMPROVEMENT IN
PROPAGATION AT THIS TIME OF YEAR, THE SECOND HALF OF THE MONTH
SHOULD BRING IMPROVED DX CONDITIONS, ESPECIALLY ON 28 AND 50 MHZ.

AS TO THE LATTER BAND, WE ALREADY HAVE REPORTS OF TRANSATLANTIC DX
ON 50 MHZ IN RECENT DAYS. THE REST OF THIS YEAR AND THE EARLY
MONTHS OF 1991 SHOULD BE GOOD TIMES FOR USERS OF 21 MHZ AND HIGHER
FREQUENCIES UP THROUGH 50 MHZ. THE PEAK IS LIKELY TO COME IN LATE
NOVEMBER. THE CONDITIONS MOST IMPORTANT TO 50 MHZ ARE THE INCREASED
OCCUPANCY AND THE VASTLY IMPROVED PERFORMANCE OF SOLID STATE GEAR
FOR THIS BAND.

SINCE LATE SEPTEMBER AND THROUGH MOST OF OCTOBER, THE AUTHOR OF
THESE BULLETINS HAS BEEN VISITING FRIENDS AND RELATIVES IN
CONNECTICUT AND MASSACHUSETTS. WE EXPECT TO BE BACK IN SPRING HILL,
FLORIDA, BEFORE THE END OF OCTOBER. WE OPERATE MAINLY ON 21 THROUGH
144 MHZ, BUT ARE SET UP FOR ALL BANDS FROM 3.8 TO 432 MHZ. OUR
MAILING ADDRESS IS PO BOX 5529, SPRING HILL, FL 34606.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 4 THROUGH 10 WERE 152, 123,
113, 149, 169, 134 AND 152 RESPECTIVELY, WITH A MEAN FIGURE OF
141.7. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME
PERIOD WERE 184, 169, 169, 168, 179, 182 AND 192, WITH A MEAN FIGURE
OF 177.6. AR

DX BULLETIN 42 ARLD042
FROM ARRL HEADQUARTERS
NEWINGTON CT OCTOBER 19, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN, N2KW, AND THE TRISTATE DX PACKETCLUSTER NETWORK FOR
THE FOLLOWING DX INFORMATION.

BANABA, T33. A MAJOR EXPEDITION IS DUE NOVEMBER 7 TO 21 BY AN ALL
STAR TEAM INCLUDING JG2BRI, OH1RY, OH2BH, SM7PKK, AND TF3CW.
SIGNING T33T ON CW AND T33R ON SSB WITH FIVE COMPLETE STATIONS, THEY
WILL BE ACTIVE ON 160 THROUGH 10 METERS. QSL CHORES WILL BE HANDLED
BY OH3GZ.

BENIN, TY. LOOK FOR TY1DX OCTOBER 25 TO NOVEMBER 3, POSSIBLY
SIGNING TY2A IN THE CQWW SSB CONTEST. THEY WILL OPERATE MOSTLY SSB,
WITH SOME CW ON REQUEST. QSL VIA IK6FHG.

TY1PS IS OFTEN ON RTTY AROUND 21088 KHZ AT 2000 UTC.

BRUNEI, V85. BOB, N2OO, RETURNS TO V85 NOVEMBER 12 TO 16, POSSIBLY
AS V85OO. HE WILL WORK MOSTLY CW ON 80 THROUGH 10 METERS.

CHRISTMAS ISLAND, VK9X. FRANZ, DJ9ZB WILL JOIN VK2RQ AND VK3DHT FOR
A TWO TO THREE WEEK OPERATION FROM CHRISTMAS ISLAND WHICH IS JUST
ABOUT TO START.

COMOROS, D68. FRANK, DL7FT, WILL OPERATE FROM THE COMOROS THIS
MONTH. HE WILL ALSO ATTEMPT TO GET ON THE AIR FROM 5R8 IF POSSIBLE.

MALAGASY REPUBLIC, 5R8. DL7FT AND THE COLVINS WILL ATTEMPT TO
ACTIVATE THIS ELUSIVE SPOT BEFORE THE END OF THE YEAR.

FEDERATED STATES OF MICRONESIA, V63. FOLLOWING THEIR SUCCESSFUL
KC6CQ OUTING, OUR INTREPID CANADIAN FRIENDS ARE DUE AT V63 OCTOBER
16 TO 31. QSL MANAGER VE3JDO WILL BE A VERY BUSY FELLOW NEXT MONTH.

MARSHALL ISLANDS, V73. AFTER THE V63 OPERATION, THE CANADIAN TEAM PLANS TO BE QRV FROM V73 NOVEMBER 1 TO 4.

MOZAMBIQUE, C9. LLOYD AND IRIS COLVIN ARE ON THE AIR FROM MOZAMBIQUE. LOOK FOR C9QL ON THE HIGHEST BAND WITH PROPAGATION STATESIDE. QSL YASME.

NAURU, C21. TRANSPORTATION PROBLEMS HAVE CANCELLED THE VK2GJH C21 TRIP. MATS, SM7PKK, SHOULD BE QRV FROM C21NI BY THE END OF NOVEMBER.

QATAR, A7. LOOK FOR AHMED, A71CD, AROUND 28480 KHZ, FROM 1200 TO 1300 UTC.

SAUDI ARABIA, HZ. 7Z1AB WILL BE A 15 METER SINGLE BAND ENTRY IN CQWW SSB. OPERATOR K2ZJ WILL QSL VIA KN2N AT THE ADDRESS LISTED IN 1990 CALLBOOK. 7Z1AB IS REGULARLY ON 21275 KHZ AT 2100 UTC, ACCORDING TO VP2ML. PLEASE REMEMBER THAT 7Z1AB QSL CHORES ARE NORMALLY HANDLED BY WB2WOW. HZ1AB, LOCATED WITHIN A MILITARY DEPOT, IS TEMPORARILY QRT.

SOUTH COOK ISLANDS, ZK1. SIGGI, TF3CW, WILL SIGN ZK1VS IN THE CQWW CW CONTEST. THIS IS HIS WAY TO UNWIND FOLLOWING THE BANABA EXPEDITION NOVEMBER 7 TO 21.

SOUTH GEORGIA, VP8. GORDON, VP8CDJ, HAS BEEN ACTIVE ON 14256 KHZ, MONDAYS AT 2230 UTC. LAST WEEK, THE LIST WAS TAKEN BY VP8BXK, SOUTH ORKNEYS. QSL VP8CDJ VIA GM4KLO. QSL VP8BXK VIA W9ARV.

ST. PAUL ISLAND, CY0. FP5DX AND VE1KM WILL BE ACTIVE ON 160 THROUGH 10 METERS BOTH CW AND SSB, FROM OCTOBER 20 TO 30 SIGNING EITHER CY9SPI, OR CY9DX. RTTY OPERATIONS ON 20 AND 15 METERS ONLY. QSL TO FP5DX.

TUVALU, T2. MATS, SM7PKK, WILL BE QRV FROM TUVALU EITHER BEFORE OR AFTER HIS C21NI OPERATION IN NOVEMBER. QSL TO HIS HOME CALL.

VANUATU, YJ. OH1RY WILL SIGN YJ0R IN CQWW CW THIS NOVEMBER.

WAKE ISLAND, KH9. THERE IS STILL TIME TO QSO AA4NP/AH9 ON 20 OR 40 METER CW. HE HAS BEEN VERY ACTIVE FROM 1000 TO 1100 UTC, BUT WILL QRT SOON.

WEST KIRIBATI, T30. THE BANABA CREW MAY ACTIVATE TARAWA FIRST. IF THEY DO, IT WILL BE A LIMITED OPERATION FROM NOVEMBER 3 TO 5.

ZAIRE, 9Q. 9T5E IS THE CALLSIGN SIG, 9Q5EE, WILL USE FOR CQWW SSB. QSL BOTH VIA K1RH. RALPH CAN ALSO CONFIRM SU1EE CONTACTS BY SIG.

SPRATLY ISLAND, 1S. DESPITE THE SUPPORT OF INDEXA, ROMEO, 3W3RR, IS STILL LACKING ADEQUATE FUNDS FOR HIS RETURN TO SPRATLY IN DECEMBER. CONTACT NT2X FOR DETAILS. AR

Other stuff deleted.

Mr. T.S. Kelso, PLEASE continue the format that you have been using.
Almost ALL Amateur and NON-Amateur programs for tracking satellites that
I know of use both the AMSAT and NASA/NORAD format.

I FOR ONE do not want to cause YOU, Mr. Kelso, any more work than you
already so unselfishly provide to indviduals who use your NASA/NORAD
postings of the NASA/NORAD format of the Keplerian values.

When the 3-line format you post, Sat Name, and 2 lines of Kep data would
NOT be immediately consumed by ORBITS III (Mr. Roy Welsh, a nice program),
I wrote a simple conversion program in BASIC to provide the required
conversion.

I greatly appreciate Mr. Kelso's postings here as they save me a long
distance call to his BBS, which, sadly for me is no longer in Austin.
A long distance call from Finland, I assume, would be MUCH more costly!

I do not know the formulae for deriving the info found in the NASA/NORAD
format that is needed for folks with 'AMSAT ONLY' capable programs.
Perhaps someone who does can post them and that should resolve
Mr. Tigerstedt's problem; and I'd kind of be interested in knowing them
as well. :^)

>>skip.
>>
>>--
>>Karl J. Vesterling vester@klaatu.canisius.edu

License or not (and I'd tend to guess not), Karl should have no problem
"working skip" from buffalo with 40 watts SSB. I've worked many people
using barefoot (i.e. 25W) HR2510s in mobile installations, even some from
upstate New York (Niagra Falls). 10m is one of those bands; when it is
"in", 5W is plenty to work transcontinental. Sometime tune in the CW beacons
from 28.200 to 28.300; you'll hear 2 to 5 W beacons all over the US. Of
course, knowing CW helps one identify which beacon is being received ;-).

**** UoSAT-OSCAR-11 BULLETIN 06 November 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-16 / UO-14 BBSs COMMISSIONED **

The Packet Bulletin Board software which has been running in 'beta test'
versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This
follows a period of intense development by Jeff Ward, G0/K8KA, and Harold
Price, NK6K, getting software ready for hundreds of users expected to access
AO-16 and UO-14.

The programs loaded to the satellites, when combined with several
groundstation client programs, implement the PACSAT communications protocols
proposed by Jeff and Harold in papers presented at the recent ARRL Amateur
Radio Computer Networking Conference. The protocols provide a connected-mode
file transfer facility called FTL0 and a standard broadcast mode for bulletins
and other items of general interest.

When someone is up or downloading in connected mode you will see packets from
the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14).
Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11.
These packets may contain some ASCII text, although each will begin with a
short binary header.
```

The PACSAT protocol suite requires special groundstation software to interpret binary headers and implement protocol handshakes. Papers in the 9th ARRL Networking Conference proceedings describe the protocols in detail. Software for groundstations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the groundstation software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following stortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

** RS-14/RUDAK-2

Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

** AO-13

The transponder schedule is as follows:

Mode B : MA 000-095
Mode-JL: MA 095-125
Mode-LS: MA 125-130
Mode-S : MA 130-135
Mode-BS: MA 135-140
Mode-B : MA 140-256
Omnis : MA 220-040

This schedule is expected to continue through 26 Dec 90.
BLON = 180 and BLAT = 0

** $BID **

Please use BID $UOSAT.105 for PR BBS use.

2837. What's the Input Impedance of a Sony 2010?

Newsgroup: rec.ham-radio
Date: 1990-11-07 04:47:23 UTC
From: mcmahan@netcom.UUCP
Message-ID: <16366@netcom.UUCP>
Source record: 6847
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I'm trying to design some simple front end antennas, filters, and amplifiers
to improve my reception of shortwave broadcasts. The problem I run in to is
that I don't know the input impedance of the Sony 2010 radio I intend to use.
There is nothing in the specification sheet of the radio that tells me what
I need to know. Any ideas? I plan on using the external antenna input jack
to provide the desired signal.

A similar question exists for all radios out there. Is there a standard
impedance for consumer shortwave radios?

+
+If you take it to the FCC lab and get it type accepted, yes.
+

None of the existing Amateur gear could pass..the controls allow for other than fixed-transmit frequencies. The power output is adjustable above the limits, the modulation can be run above limits, most rigs have FM - a mode that is illegal...nope, you couldn't get it type certified; it just won't qualify! The rules were designed to force the manufacturers into selling radios without those capabilities, and of such design that it is difficult to add such capabilities...like why do you think that Dynascan/Cobra keeps on making the Cobra 148GTL??? Because it's *very* easy to modify...and that's why people keep on buying them! Because of the way in which the rules were written, once a design is type certified so long as there are NO CHANGES, the company can keep producing and selling them..if they change something it's a new set of rules! The latest set insists on making it damn near impossible to modify the rig for increased frequency coverage (the '148 can go from 26.965-27.405 to 26.815-28.045 with just 3 silly jumper wires and 3 switches added to the existing PLL!) more power (the '148 can be turned up to almost 20w PEP SSB and 10-12w RMS for AM use!) or additional modulation modes. (again, the '148 can be made to do FM by adding a little kit that costs $20!)

In addition, it's pretty obvious that the manufacturers would rather sell millions of radios than thousands...hence they decided to do both by building units like the HR-2510/2600 - Ham radios...sure! A simple jumper, a cap or a new PLL chip and either of those units can operate on 26.00-30MHZ...presto! ..no type acceptance laws to worry about! It's NOT a CB! Yeah RIGHT!

The FCC hasn't got the time to bust hams for running their gear on 11 meters, and your risk-factor is small PROVIDED:

1) you DO keep it turned down to 3 or 4 watts RMS - otherwise you stick out like a sore thumb! Just like the guys that run linears only cleaner! ..if your antennas are really good on 10 & 11, crank it down more!

2) Watch your modulation % - most stock CB's have 65-70% max...a preamp mic (I use the Cobra Dynamic Plus..) turned DOWN to 2 or 3 will make you sound pretty much like a *verrrryyy clean* CB radio...most amateur mics sound pretty awful on AM..great for SSB but thin or hollow on AM, especially if the people listening to you are listening on CB receivers..which are not the greatest!

3) AVOID THOSE "funny freqs"...lot's of CBers insist on using the band between 27.405 and 28.0 You (as a HAM) should never operate there! You could lose your license in a flash! Most CBers never get caught..but I've know some Hams that have! A word to the wise...if they ask, just be cool..tell 'em you don't have "freqs"! Stick to the 40 channels...plenty of people to talk to there, besides some of the freebanders have been known to use their equipment for illegal acts - something you'd just hate yourself for if the FCC nailed you and decided that you were in on it!

4) You don't cause problems...TVI, RFI and the like, even complaints from other 11 meter users can be the catalyst for a complaint. Remember that most of the people on CB are non-technical, they tend to carry around a lot of misconceptions about the science of radio...don't abuse them for this: TEACH THEM! ONE AT A TIME! INVITE THEM OVER (if you trust them..) AND OFFER TO LET THEM BE A GUEST OPERATOR! YOU'LL BE AMAZED! Some of them will be so jazzed they'll go out and get a Novice ticket with a little encouragement from you! (I'm rather proud of the 12 people I did this with - they're good hams, they wern't bad CBers...)

5) Keep a low profile! The FCC is sooo overworked, and sooo underfunded it's unlikely that they will be doing much about 11 meters any time soon. They'd probably like to just ignore the problems there unless there is a reason to do otherwise...like those clowns that shout obscene remarks into their mics..or run a gallon of power...if you're cool about it, no one will ever know you're running ham gear..unless you tell them! And if someone *does* ask..tell them you're running a Stock Cobra 148GTL with a power mic!...there's millions of those things out there and it won't arouse a bit of interest..

2840. NASA Satellite Elements Format

Newsgroup: rec.ham-radio
Date: 1990-11-07 12:03:00 UTC
From: Pete_Simpson@dgc.ceo.dg.com
Message-ID: <9011071203.AA00038@rtp40.dg.com>
Source record: 6850

CEO summary:
A message recently requested that the "actual" Keplerian elements be
posted to the net instead of the "two line format".
I'd like to thank Dr. Kelso for his reliable postings of the latest
elements (along with a format description). It's been several years
since I first started getting Info-Hams and Dr. Kelso has hardly
missed a beat. I believe the two line format is quite sufficient for
two reasons. First, Instant Track software loads it automatically and
second, it takes up less space on the digest than the longer "AMSAT"
format.
Again, thanks to Dr. Kelso for providing a most valuable service.

Check into Europe, or Japan, or about every country other than the USA.
They have no-code licenses. As far as I know, all with positive effect.
In fact, at least in Holland, there are more no-code licenses than
code-full licenses.

This point has been made in the past. Usually, one studies a few months
on the subject before making a decision. Where were you?

>from burning up a lot of valuable electronic parts in the process.

Why? Myself, I have a no-code license, and yet I am allowed to use CW
if I like. The only requirement is that I ID. However, if my CW is bad
enough not to be copyable, ID in phone is perfectly legal within
my license. Some people use this possibility to study CW after they got
their no-code license and they decide they want a full license after
all (a very popular grow-path).

The need to know technical stuff is because 1. you need to know about
radio to successfully use it within the spectrum of modes the ham license
provides, and more important 2. you need to know about radio to lower
the chance that you cause disturbance to others, especially using
the (e.g. high-power) privileges your ham license provides.
If ham-radio were just low-power FM phone, radio knowledge
would be less required, but at least _you_, being a ham,
should know what your transmissions can do to the operation
of neighbour's stereo :-).
That is why you may use modes what are more likely to cause
disturbance (SSB) and higher output levels.

I guess that if you burn up electonic parts in the experimenting process,
the {FCC, PTT, RTT, DBP, ..} will probably feel sorry for you, but you
probably learned from it in the process. You didn't harm others.
They wouldn't mind you burning some parts.

On the other hand, you should know what to do to make it very unlikely
that your just-built new transmitter doesn't home planes to your backyard

instead of the nearest airport.
Pirate transmitters built by people without radio knowledge tend to have
some nasty side-effects.

> 2. The international treaties governing radio demand it for activity
>below 30 MHz. As all current ham licenses have privileges below 30 MHz,
>it is required for all current ham licenses.

That is why many US pro-coders suggest a no-code [vus]hf-only license.
If only >30 MHz is allowed, morse code tests are not required.

My personal feeling is that these no-code licenses are very useful,
and have proven the concept for at least 30 years here.
I think it is time for the USA to come by to the rest of the world.

10 meters was just as bad. For most of the afternoon, it was virtually impossible to copy packet as the 50 over 9 CW stations completely blanketed the S5 packet stations. Other than the blatant interference that is common during contests, makes you wonder what happened to "use only the power necessary." If CW is so much more efficient, why do CW ops run so much more power than the packet stations??

I wish there were at least one weekend without a contest. There are other uses for the spectrum, and I work all week too.

Regarding the folded dipole with a terminating resistor (T2FD) ...

Remember that a simple 50 ohm resistor will give you a VSWR of 1.000
on all parts of all bands.

Give me an antenna with lousy VSWR. At least, if I tune it a bit,
it will radiate!

I am posting this for WD1V, the moderator of Macnet.
Please do NOT respond to this account.

Macnet is FREE and available to all. What WD1V has done is put together,
via packet radio,is a list of hams throughout the world who use Macintoshs, so
that they might converse about Macs and ham radio. He also maintains a
Macintosh public domain software base for ham radio. Currently, the base
is about 10 Megs! The following is his Invitation to Macnet as well as a
list of the public domain software disk names. Send a SASE with a FORMATTED
disk for the Macnet general info and the list of hams which WD1V has compiled.
For each disk you want,send the disk name as well as a FORMATTED disk and SASE.

As soon as you send your stats in, you are a member of Macnet.

I would like to thank John WD1V for his efforts to bring together the Macintosh
Ham community. He has done a very good job.

Please do NOT respond to this account. Contact John WD1V via packet radio at
WD1V@KB4N.NH.USA.NA, or send a letter to the address below.

Well, during the the CQ WW RTTY contest RTTY was in the "AMATOR" band
segment and in the top end of the "CW" band. On 40 meters, the DX
window for RTTY is at 7.03. I have worked European stations there.
The ARRL RTTY Roundup tends to spread out of the "RTTY" band a bit
also. Seems to be some give and take here. Legally CW can be worked in
the entire band.

John,
You probably will find that good cable is far cheaper than a remote base.
for example, running a RG213 run of 1000', you can probably buy the cable
in those lengths for 300 to 500 bucks...

I have set up a remote base on 440 MHZ (actaully repeater / remote base, 442.150) and it
controls my antenna selection, rotor heading, tunes up, down, etc.
selects all modes, the whole thing... ok, so how much $$$?
repeater: about 1k, controllers for repeater, remote base, etc. $2K,
antenna for repeater 400 buck, etc. etc. plus a lot of time getting it all
working.

It works great, and others can benefit from it, but I do not think MOST people
would spend that sort of money and effort when a less than 1000' run of low
loss cable would do it...

on VHF/UHF, you may want to look at a nomograph to compare line loss vs. height gain, plus
see the "blind side" of the hill....

If you want more details on the remote base solution, it can be done cheaper;
I have a friend who did his using a c-64, homebrew repeater, etc., and his is
cheaper, but would still be more than the cable, higher time investment,
more maintenance, etc.

even with off the shelf components, it is not a plug in and play solution...

cheers
Dave

I was imprecise. The auditory system doesn't include the signal processing
equipment on the back end, so in that sense, you're right. However, our
signal processing equipment is trained for speech and not CW; there may
be a few individuals out there who use CW more than they speak, but I
wouldn't bet the farm on it.

>So one might be able to actually hear both speech and CW frequencies with
>equal ease, but I submit that it is easier to mentally "tune" the auditory
>system for a single frequency under weak signal conditions than it would be to
>tune it for the entire speech frequency band. IMHO this is the analogous to
>peaking a tuned circuit for a single signal instead of flattening it into a
>broad-banded device.

Again, this is probably true for signal DETECTION, but not for DECODING.
First of all, human beings make use of intonation and inflection for some
information, much of which is redundant. More importantly, though, is that
the symbol time for speech is much longer than for CW. This is critical in
a Rayleigh fading environment, where you have short deep fades. Those
short deep fades completely cover one or more CW symbols, but only part of
a word (arguably, part of a phoneme). Above 30 MHz this isn't the case,
since Rayleigh fading does not predominate the way it does at HF. Here
again, CW does have some merit, although much of it is lost in lousy
wide filters.

It also may melt.

I don't know about the t2fd, but if you peruse the ARRL handbook, you
can find nonresonant antennas with 10+ db of gain even after
accounting for loss in the terminating resistor. They are a bit large
to be rotatable, but if they are pointed in the direction you want
they should work well. In some cases they can be remotely switched
from resonant to non-resonant modes just by putting the termination on
a relay.

You might want another antenna for a specific band, but to me it is worth
giving up 2 db in return for something that will load up anywhere from
160 to 10 meters with no hassle.

Great! Could you please post it to the net? I'm sure that there's many others who are not unix wizards who would also like to know how to do this. Let the muttonheads argue among themselves and leave the rest of us alone!

I recently purchased an old Johnson Matchbox, Jr. Unfortunately, no manual came with it. Does anyone have a manual for it, or its big brother, or know where to get one? I'd be willing to cover copy costs and provide SASE. Thanks.

Well, Ham RADIO is, in fact, old men (young men, old women, young women, even children) playing with radios. That's why it's called amateur RADIO, IMHO. Bob West issued a challenge in a recent posting to define the "new image" of amateur radio. Let's see your idea of how the image ought to be reversed.

Will it be amateur radio, wireless computering, what?

For what it's worth, I tried the above on my Icom IC-2GAT, serial number 02880. The offset step size can be as low as 5 kHz; the step size when setting it matches the VFO tuning step size. Thus, if your tuning step size is at 25 kHz, your offset step size will be 25 kHz.

Of course, the 2GAT is (as far as I can tell) a totally different creature than the 24AT or 2SAT...

I repeat a point I made in the past. Morse is a marketing disaster.

I work at an establishment that designs advanced computer networks, including hardware, software, protocols, etc. This place is lousy with EEs. Yet I have met very, very few people interested in getting started in ham radio for the first time. A few have gotten licensed again after years, or after being interested as kids, but few "virgins".

Sometimes people begin to get interested. Then they inevitably ask the question, "Do you still need to know the morse code?" Given that the answer here is still "yes", they immediately lose all interest.

I sometimes say, "But the FCC has indicated that they'll probably drop it soon". They then suggest that they may become interested after that happens.

These aren't spoiled wimps. They just don't want to waste time learning an antiquarian skill as a hazing ritual. If you want to communicate, the Usenet is zillions of times faster and more reliable than ham radio will ever be. They want to hack, but feel that the hazing code makes a fool of them.

And I'm a CW operator, so don't give me any crap about my own lack of effort. I like to _use_ CW. I just don't like to _require_ it.

Hi...

I'm posting this question for a hang gliding friend of mine, who has recently become a ham (Dave - N3IBY). PLEASE respond directly to my mailing address, if possible, for I have spotty reception of this mailing list. I will post results/comments, if need be, back on the net.

tnx... andy ka1gd

zwirko%v5120.decnet@ccf.nrl.navy.mil

.....

Is there anyone out there who has received WEFAX off the geosync satellites?

According to the Handbook, there are several satellites which broadcast WEFAX on, or around 1691.0 MHz. Also there seems to be some wx transmissions (WEFAX?) on 137 MHz. Does anyone know the details of any of these transmissions, ie. mode/modulation scheme or hours of operation? Has anyone successfully copied WEFAX on 137 MHz or 1691.0 MHz and if so what receiver/downconverter/radio/ant were used and where might I find more information? I am interested in both kit and off-the-shelf units. I have also seen varying amounts of software for the KAM, PK232 and other all-mode digital boxes, which claim to save and display data on PC's. Does anyone have any experience, or comments regarding these types of products.

Any help would be much appreciated! Thanks.

I'm sorry, but I believe my message has been completely misunderstood.
I would GREATLY appreciate receiving the keplerians in 2 line format, it's
the FORMAT DISCRIPTION that I believe most people have already seen and
copied(if interested). Maybe there's something wrong with my host computer's
net connection, but the last month I have not received any Keplerians, only
a DISCRIPTION of the 2-line.

In short, it's the 2-line KEPLERIANS I would appreciate receiving.

And, yes, Thanks, Mr. Kelso for the work you've done in providing these
keplerians, I just wish you didn't stop.

>learning it, and then get on with being brilliant.

But.... why even have it in the first place?

What does the existance of the requirement tell the brilliant mind about
the attitudes of ham radio?

Which is the worst attitude problem:
1. Not getting into ham radio because of irrelevant requirements.
2. Continuing to have irrelevant requirements

(The question applies ONLY to privileges above 30 MHz)

>If the HF Olde Phartes want to be masochistic, let them. You don't need
>13 or 20 CW for getting the bands needed for some cutting-edge work.

But they are also being sadistic as well, with these requirements.

In terms of information to spectrum ratios, CW needs to be that narrow
to justify its low information rate. And it CAN be that narrow. It's
just inconvenient to the human.

Less spectrum is also not necessarilly better, either. Ham radio growth
is nowhere near the growth of other services. They need OUR spectrum.

So maybe America *IS* fat and lazy. A Morse Code test isn't going to
change that. The lack of one might. Get someone into ham radio that
would not because of the test, and they might get interested in one of
the technical career areas, and they might start learning and working
on something and quit being fat and lazy.

If 5 WPM is ridiculously easy to learn, what good is the test at all?

Hey, that makes sense! Pass the minimum 5 WPM for access to HF, and
then toss increased speed into the whole question pool. That way one
who is more technically inclined can upgrade that way, and one who is
more operator inclined can upgrade that way.

But are we allowed to have anything that make sense in ham radio?

No one says that everyone has to be interested in everything in ham radio.
There is *NO* mode that interests, or should be expected to interest,
everyone with a ham radio license.

But I do know some "old timers" who are into packet radio, such as W9CD.

Maybe you can argue why we should not, but in the USA we ahve subbands
where it is not legal to use voice, and us VHF-er's are proud to sport
(well maybe some of us) the ONLY TWO CW ONLY subbands in all of ham radio
here.

The point is that if your CW is no good, you probably cannot make a
good legal ID unless you do it by machine. But this is just sending
skill. One can probably send a legal ID at 1.2 WPM anyway. I've done
slower than that (in 2m).

So, are you saying that all automatically controlled 2 meter repeaters
with an autopatch are not legal?

The control would have to be either AUTOMATIC (which you say is not legal)
or would have to be REMOTE, which requires a control link on an AUXILIARY
frequency, which does not include any portion of 2 meters.

I checked this week two ICOM HTs.
2SAT with serial number 7021, and 24AT with serial number 2488.
Both are "opened" for receive as appeared on the net, but both
have an offset only in 25KHz steps. So for example I cannot program
them to receive on 145.600 and transmit on 145.010 (580KHz offset).
Is it a bug on those HTs or it can be solve by some modification?

The answer to the mystery is that a dipole 1/2 wave long is not
resonant! The formula for an exact halfwavelength is

halfwavelength = 492/frequency in MHz.

The widely published formula for a dipole antenna is

l = 460/frequency in MHz.

Jim's explaination of the physics is as good as anything I can offer.
The practical result is that the wire must be cut a little shorter to
get zero reactance at the feedpoint. This is even before you do any
adjustments for the real world objects like houses which may be near
your antenna.

I don't think so. I believe you must have a special service license to modify a radio that opperats in the CB spectrum. On the other hand, I think you could modify a CB to work in the 10 meter band, because then it wouldn't be a CB radio anymore. I also think the FCC could care less in either case.

How do you think I got my Extra? (Hint #1: I earned it in 1973, well before I had a personal computer. Hint #2: when I was active in Field Day, most of my operation was in - surprise! - CW).

Mark Zenier:
|> And he multiplied where he should have divided.

|> The bandwidth needed to send a 20 WPM Morse signal is about 17 H.

Yeah, looks like I did. But my BW figure of 24 Hz is probably closer to reality since you'll need some "excess bandwidth" over and above the Nyquist requirement in order to time the beginning and end of each symbol accurately. Yes, CW (or any digital signal) can be sent in just the Nyquist bandwidth. But if you do, the intersymbol interference goes to zero at only one instant in the middle of the bit, and there will be a LOT of jitter in the zero crossings between the bits.

Depending on how you recover bit timing at the receiver you may not care; the Coherent CW stuff will work fine with the smaller bandwidth as long as the receiver's bit element clock is properly synchronized to the transmitter's in some other fashion. If you want no jitter at all in your zero crossings, you'll need 100% "excess bandwidth", or twice the Nyquist bandwidth. That's 33 Hz for 20 wpm. Real synchronous digital modems typically operate somewhere between 0 and 100% excess bandwidth, depending on how they recover clock.

And, of course, all this assumes that you have stable, phase-linear filters - which nobody without DSP is likely to have.

Anyway, the original point of all this was to correct - once again - the mistaken notion that CW is somehow more "bandwidth efficient" than any other mode. Whether you use 17 or 33 Hz, both numbers are a lot smaller than the 400 Hz bandwidths of most real CW filters.

Phil

2882. Repeater antennas (Diamond?)

Newsgroup: rec.ham-radio
Date: 1990-11-08 02:28:43 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <32491@netnews.upenn.edu>
Source record: 6742

Has anyone had any experiences, good or bad, with Diamond antennas for repeater use? The repeater is on 440, and from what I can tell in the Diamond catalog, the only 440 antennas they make are actually dual band (2 and 440), but seem to have excellent specs considering the cost when compared to other commercial antennas.

Any other budget-minded suggestions for repeater antennas? Stacked dipoles, homebrew multiple 1/2 wave element collinears, and G6's have already been thought of.

Also, anyone know of a good source of fiberglass tubing for vertical collinear homebrewing?

Minor quibble here: an auxiliary station is only one way of providing remote control. I know of at least one open autopatch on 2 meters that ran with two phone lines, one for the patch and one for remote control...

>has me wondering.....

Will 40 watts really allow you to "talk some skip" better than 25 watts?
In my car, I use either an IC-735 (100 watts) or a converted Cobra CB.
(10 watts) It doesn't seem to make much of a difference. Perhaps it
would for local communication, but not when the band is open. Power does
not seem to be as much of a factor on 10M as on other bands.

Open-wire feedline is lower loss, and is cheaper if you make it yourself.
It would require baluns at each end or tuner.

FCC no longer gives tests for the ham licenses. This is now done by volunteer examiners who are certified by several national Volunteer Examination Coordinators (ARRL is one.) Best bet is to find a local ham who can help you out. I bet there is a club at UCSD. If you can't find it on your own, write ARRL, 225 Main St., Newington, CT 06111 (the national ham radio society), and they can send you the address of a local ham club.

>you collectors out there.

>1. I'm assuming that the lettering
> should be white. Am I correct?

Yes, I think so.

>2. What should the finish look like
> on the inside chassis and the transformers, etc.?

Modern chassis's are made of aluminum, but some antique models use steel
or copper-plated steel. These tend to get badly tarnished.

>3. Whats a quick way to clean the metal
> surfaces inside the cabinet?

The QUICK way is the "total immersion" technique. You remove all the tubes,
plastic parts, dial cords, and other breakable items. Then you dunk the
whole radio into a tub of warm, soapy water and scrub with a brush until
clean. Then you rinse it out VERY thouroughly -- you want to make sure you
don't leave any soap residue inside IF transformers, etc. Then you shake
out all the water you can and bake it in the oven on lowest heat with the
oven door slightly ajar. Leave it in for a long time until you are sure
all the water is evaporated from inside all permeable components.

I have done this before with old radios, and it worked like a charm. I have
heard that there is danger of washing away the lubrication in the bearings
of potentiometers and variable capacitors, but I expect that a radio this
old probably doesn't have much lubrication left anyway. There are lubricants
you can buy for this purpose if it worrys you.

If my usage of this news group was being paid for by anything
but funny money (money allocated by department for computer use
and will be lost if not used) there is no way I would waste it on
these flames on flames of flames. I deeply respect the rights of
individual free speech and all the bill of rights including the
second one. On the Second Amendment I disagree in that I
believe gun control can control crime. You simply make every one
wear one. The gender pronoun flap is ridiculous on this form. If I
wewr to add a few comments about the KKK, ARRL, NAACP, NCAA, Pete
Rose, mother and the American flag, Everyone would have a target
for their flames..

Since we seem unable to restrain our flames I propose the
following FOF (Flaming Old Farts or Flames on Flames) reports
ranging from 10 (absolutely for) to -10 (I'll die before I will).
Just send the subject line delete the rest of the msg and add
your FOF report and call.

FCW 10 I'll fight for cw from the grave.
-10 if every one who ever used cw disappeared from the face
of the earth the world would be a better place.

FSX 10 Women are obviously superior & should be worshiped as
divine goddesses.
-10 Keep 'em pregnant in the summer time and bare foot in
the winter.

F38 10 You can have my gun when you pry it from my cold dead
hand.
-10 Rob me, rape me and kill me I wouldn't dream of
defending myself.

FOF 10 I agree 100 per cent with your opinion and I nominate
you for the FOF hall of flame.
-10 You are obviously retarded, likely harelipped and your
girlfiend probably says baa when she gets a hair cut
at the local CB store.

We can then just average the FOF reports and have a numeric
consensus of the mood of the group on specific subjects.

Please email me your ideas of FOF reports and I will make a final
report of the collection to the news group.

If you have remote control, you have a control operator at a control point
(required by 97.109(c)). If the remote control link is by phone line, then
someone has to be there controlling it. This won't work for an unattented
repeater (automatic control) by a user who can't call it up on the phone

Why call the repeater to make an autopatch, just call direct. Or is it
long distance?

2895. Sweepstakes! (Mojo's back)

Newsgroup: rec.ham-radio
Date: 1990-11-08 08:17:22 UTC
From: mojo@netcom.UUCP
Message-ID: <16434@netcom.UUCP>
Source record: 6755

Okay, it's four days later, but I'm still basking in the afterglow. I spent 24 hours working the CW Sweepstakes this weekend, and it felt *good*.

I operated from the West Valley Amateur Radio Assn. club station in the Monte Sereno Red Cross office, using my own call. The equipment was a TS-830S, my ancient AEA CK-1 keyer and bencher paddle, a pair of hi-fi Sony headphones that lost all their foam during the contest, a tribander at 30 feet and a couple of dipoles. Perfect SS station! :)

From Class A, my final tally is 792 QSOs, 76 sections.

Highlights:

Having so many folks say "HI MOJO" and "GUD TO C U ON THE AIR" from people I didn't know (or think I knew)!

Working K1ZZ and W1AW in the first couple of hours.

Spending an hour on the 15 meter novice band running novices steady for 32 QSOs. Hardly a single break! Running 18 wpm on the keyer, and those guys were fun! There were certainly a lot of 2x2 and 2x1 calls among the crowd! It was a fantastic way to spend a slow time on Sunday afternoon.

Being called by WP4IXI during that run to pick up Puerto Rico for my 76th section!

Lowlight:

40 meters was awful from this station! Couldn't be heard worth a darn. Maybe I'll look into the antenna a bit. Any suggestions? Maybe an eastern-pointing sloped dipole?

I'd love to think my 792x76 would be good for a certificate in A class, but I know that the competition in SCV is mighty tough. I'm almost chicken to ask around and find out who beat me. :)

I am thinking of building a 5/8 over 5/8 2m colinear. I have all the parts
required and am thinking of placing it all in piece of PVC 2 inch diamemter
waste water pipe. This will keep it rigid and will produce a nice looking
design.
I am not sure however on the RF attenuation produced by the plastic pipe.
Would anyone out there mind telling me the attenuation properties of such a
pipe and some discussion of the attenuation properties of plastics at
all frequencies would be interesting. If no-one has the information to hand
could someone please point me in the direction of a book that would.

Thanks in advance.

Too bad the idea of using a repeater is slowly being inculcated
into our collective consciousness. Whatever happened to simplex?

I heard an ongoing conversation on a nearby wide-area coverage
repeater the other day between a regular long-distance (250 miles)
"commuter" and a traveller passing through town. Our commuter
type has a history of tying up wide coverage repeaters for
literally hours at a time, so it came as no suprise that I
was listening to yet another instance of it.

Here, he was separated from the other station with whom
he was conversing by ONE CAR on the highway. They were
20 feet apart and talking through a clear channel repeater
over 20 MILES away!

When he asked what the frequency of the next repeater down the
line would be, I jumped in and sarcastically added "146.52".

He matter-of-factly requested "What's the offset?".

I just reached down and turned the radio off in disgust.

>dual band (2 and 440), but seem to have excellent specs considering
>the cost when compared to other commercial antennas.
>....

Jeff, on my repeater, I have tried two of them and a dB products...

the HD500M (?) had 8 5/8 wave in phase, and had about the same gain as the
dB products antenna...
I now use a X700M (?) which has 11 elements, 5/8 wave each on 440 MHz, and
it seems to be the superior one (costs about twice as much, etc.)

two complaints about them which the dB products doesn't have...
1) they use UHF connectors; I prefer N types at that frequency...
2) being non- rigid, many users experience fading as it "whips in the wind"
altering the radiation pattern compression.

the average user accessing my repeater prefers the dB products...
so why am I using the others? Wind loading... in a 60mph +++ blast we had this
summer, it loaded my 2", 1/4" wall mast enough to bend it!!! this caused some
tower work to replace the mast, and I figured the "flexing" of the fiberglass
was better than replacing masts... thoughif I had replaced it with a thicker
wall, or a steel mast, it would have been fine I suspect.

If I had a taller tower, and could side-mount the db-products one, I would have
done it.

You mention cost... well, a 8 element db products does cost more new than the
diamonds, but.... I have to admit, I paid about 100 buck more for the x700m
than I did a perfectly good used dB products job...

So, I recommend looking at whether you NEED flexing, less wind load, and then
choos accordinly, not overlooking the possibility of a good used dB products
antenna... many police departments, etc. are replacing their old external
phasing harness ones with the new fiberglass jobs, and they can be had very
reasonably, and are EXCELLENT.

Antennas and coax are the worst place to skimp on in a repeater installation
(mayby not so humble opinion).
good luck

This might be a dumb response, too (I'm not exactly sure what you mean),
but 10 meter FM is a whole lot of fun, especially through repeaters ... it's
a whole different type of QRM and QRN that, to many people's ears, is just
as much fun but without the "SSB Headache" I get after a few hours of
over-used speech processing and tin voices.

I wonder if any of these FM radios allow you to work "splits" for repeaters.
I have heard many stories about eliminating the "skip zone" by using
repeaters - sounds like fun!

2901. 15 meter monobanders

Newsgroup: rec.ham-radio
Date: 1990-11-08 16:16:44 UTC
From: cep@cci632.UUCP
Message-ID: <42094@cci632.UUCP>
Source record: 6761

15 meters is my favorite HF band. (I reserve the right to change my mind about this depending on propagation from month to month :-)).

Why isn't there the equivilent of a 2510 for 15 meters? Or, is there one that I don't know about? Seems to me it wouldn't be that much harder to build than the 10m one, and you could leave off the FM portion and just leave CW, USE, and LSB (packet)

Anybody know anything about NCG attempting this back in the early 80's?

Chris/WZ2B

>It seems to me (based on my experience) that if a code requirement keeps
>even ONE otherwise qualified person from becoming a ham, it is a
^^^^^^^^
I am ONE (at least I was the last time I checked :-) and the code requirement is keeping me from becoming a ham. I'd love to become a ham, I can answer the theorie questions up to Advanced without having to memorize the answers, I used to operate modified ham equipment on the CB band in France, back when provincial French CB was populated with reponsible/technical people, when CBers where invited at the local ham club meetings, etc.. (I am retricting this comment to the small area of France where I lived in at the time. I stopped using CB when it got spoiled by frustrated people) So I think I can be a "qualified person".

I have little time for my hobbies and therefore I am very carefull and selective about what I spend my time on. I do not find any use for CW right now, nor do I have time to learn it (even 5WPM) to get a novice license. However, if I had a no-code license I could someday be interested in CW and learn it "on-line" with friends on the bands and with a meaningfull purpose: TO COMMUNICATE.

I speak 8 languages and always found it easier to learn them while in a communication situation. I did not speak Japanese before going to Japan, after one month, I was getting by (more than 5WPM ;-). I had tried to learn Japanese prior to this experience with no success, because I was not motivated by a COMMUNICATION need. Of course if knowing Japanese was required to enter Japan, I might have never been to Japan, I might have never learned Japanese. A great loss to my Japanese clients.

I felt that I had to add the this already too long thread (count there a vote in favor of rec.ham-radio.tech) because I did not see any comment from the non-ham side, people who would like to become hams but are kept from it because of the code requirement. Sorry if you feel this is a waste of bandwith.

2903. Re: Repeater antennas (Diamond?)

Newsgroup: rec.ham-radio
Date: 1990-11-08 18:56:12 UTC
From: mleech@bwdlh131.bnr.ca
Message-ID: <1990Nov8.185612.1815@bwdls61.bnr.ca>
Source record: 6763

The experience we've had with the DIAMOND 2M/70CM antenna has been somewhat mixed. Some good, some bad. From an RF point of view this beast is a great antenna--we haven't seen the fading you describe--even in the worst winds.

We had had a *serious* problem with the mechanical arrangements on the thing the *entire* antenna is supported by this 8cm long casting which slides into the aluminum mast mount. The problem is that there's only 1 bolt that attaches the mast-mount to the casting. In even moderate winds, the stress on this 1 bolt is enourmous, with the result that the aluminum mast mount gets chewed to bits. This causes some intermittent RF problems, because the N connector is "grounded" to the casting with the assitance of this single bolt. We're re-drilling the cast with two more holes, tapping them and using another pair of bolts to try to reduce the stress on the mounting system.

COMET makes an antenna similar in electrical characteristics to the DIAMOND. We haven't actually put it up yet, but it seems to have a far superior mounting arrangement.

From: jl@newt.sbi.com
Message-ID: <369@chi.newt.sbi.com>
Source record: 6764

I am looking for any information (i.e. schematics, manufacturer address,
mods, etc...) for a BELCOM LS102. I think this equipment was build in europe.
It is a mobile 10M tranceiver AM,FM,USB,CW with 10W output. The local ham shops
have never heard of it.

The equipment has been modified to operate on additional frequencies, however,
when doing so they removed the CW key input, and did other weird things to it. I
need to tune the transmitter (with a dummy load as I don't have a license) and use
it as a receiver untill I get a license that allows me to use it in transmit mode.

Anyone with information should e-mail directly.
Thanks.

ENGINEERING ASSISTANCE NEEDED:

I am trying to get an engineering drawing for a telescoping tubular
tower manufactured by the now defunct Wilson Systems Inc.
formerly of LasVegas Nevada.

I understand that this was sold to "TRISTAO"something....
but info on them is scarce.

Any ideas? The city is giving me lots of grief on stamped drawings
(in addition to other things) and a drwaing would be alot easier than
sawing off a sample of each tube and paying for metalurgical studies.

TNX de WA8ZHN / PRBWON: still fighting.

Bob West asked for a definition of tomorrows amateur radio operator. Here's my 2-cents' worth:

Amateur radio will continue to be a RADIO hobby. It will welcome all individuals who have enough interest in radio to learn about it. It is broad enough to accommodate many interests; from CW to spread-spectrum; from 1.8 kHz to 180 Ghz. Amateur radio should not evolve into a group of special-interest factions, each with its own agenda. Instead, it must accept the many broad interests as equal in stature with the rest.

The individual amateur should be knowledgeable about amateur radio, and that means its beginnings as well as its present. Testing will continue to cover all modes and privileges that the amateur radio operator will receive with the granting of his license. There should be but two classes of license: the entry level, and the full-privilege license. Entry level Hams will have a basic knowledge of the hobby and its history; know what the band limits, power restrictions and operating rules and practices are; understand simple electronics principles and electrical safety; and be able to copy the Morse code at 5 WPM. Entry-level licensees will be able to operate any mode that the technical requirements of the exams (TBD) cover, and on any band, with power restricted to 200 watts RF at the transmitter antenna terminal.

The full-privilege class exam will be similar to the old FCC second-class with radar endorsement in complexity, with added provisions for the current modes of operation and state of experimentation. The holder of this license will know something about every aspect of amateur radio. This class of license will also require copying 5 WPM of Morse code. Power limits will be extended to 1.5KW, and an additional segment of each band will be reserved for the full-privilege holders.

An entirely new hobby class should be recognized by the FCC: that of the computer hobbyist whose only tie to radio is to use it as a substitute for wire links between computers. Rules and requirements for this service should be developed by the computer hobbyists, not radio enthusiasts. A portion of each band above 30 Mhz would be set aside for this hobby. The new service would appeal to those who either won't or can't meet the license requirements of amateur radio, but who may be able to contribute to the science of communication in some other way. Current holders of Ham licenses would be required to meet the new license requirements, and vice-versa, if they desired to operate in the other bands would nee(service). Under this concept, a person would need a separate license for each service if they intended to operate in both.

Equipment used would have to meet a TBD set of acceptance standards issued by the FCC if its purpose is to emit RF energy, and the output power is greater than 50 watts. At 50 watts and under, no type-acceptance would be

required, but the user would be responsible for certain technical aspects of the emissions.

I realize that the new hobby class is not amateur radio, but I do think that there should be provisions for this variation of the radio hobby. It would be up to the present computer hobbyists to organize themselves into a national charter, similar perhaps to the ARRL, to define itself and liaison with the FCC to get it in place.

There is room for data-stream transmission in amateur radio, just as there is room for SSB, AM, FM, CW, etc. Practitioners who desire the privileges of a radio hobby should be willing to meet its requirements, regardless of how they plan to communicate. Under the new service, there presumably would be room for FMers and CWers, provided that they were willing to conform to the rules and requirements of that service.

Amateur radio enthusiasts will continue to provide emergency communications on their assigned bands while operating as Hams. They will continue to pursue contesting. They will continue to perform community service functions as before, and they will ALWAYS be ready to help the new, inexperienced person to get into the hobby, and to increase his/her skills once in.

This might be a dumb response, too (I'm not exactly sure what you mean),
but 10 meter FM is a whole lot of fun, especially through repeaters ... it's
a whole different type of QRM and QRN that, to many people's ears, is just
as much fun but without the "SSB Headache" I get after a few hours of
over-used speech processing and tin voices.

Being a lowly tech I haven't worked 10 FM directly but the Worldnet
repeater system here has a 10 meter node. Through 440 I have worked
many countries and most states either mobil or with an HT.

I want to throw in a plug for the use of PL (CTCSS). There is an ARRL
plan for 10 meter PLs based on the reqion where the repeater is
located. This would reduce significantly the amount of QRM caused by
bringing up 3 or 4 repeaters in different parts of the world and would
allow much better QSOs.

Me too! I also remember the "negative reinforcement" method of
radio education... Like the time I left the 600V power supply open on
the floor of my room, came back from supper (the lights were off),
and _STEPPED_ on the thing in my bare feet! OUCH!

Then there was the time that I learned that with a full-wave
center-tapped rectifier circuit, the ENTIRE PEAK VO
LTAGE of the transformer is across each diode, every half cycle. In
this case it was a 1000V, 1/2 amp supply for my
four-sweep-tubes-in-an-arc5 linear.... One of the diode stacks shorted
out, and every light in the house blinked at a 60Hz rate. Nice
effect, until the house fuse blew....

>>> Re "Microwave and RF Forum as a mailing list/newsgroup

I'd really appreciate it if this were possible. I tried to send some mail to (I think) Jim Grubbs on Fidonet but it was bounced (even using the REPLY command from the Usenet reader :-).

From New Zealand, Fidonet access via phone (I'm guessing - we don't have it here) would be cripplingly expensive - like a choice between reading the group and eating :-), whereas Usenet and Internet mail are already available.

To Summarize: One (informal) "Yes" vote for either a mailing list/newsgroup.

Cheers

There are still plenty of chassis made of steel, which is cheaper
than aluminum, and gives a better ground. Aluminum reacts with the
screws and ground lugs, forming a white dielectric film.
>

I have used this technique... with really old and gungy radios it's
really the only way. But I did it without soap, so there was no
residue to worry about. Just take'er out front and have at'er with
the garden hose and a toothbrush....
Then, instead of sticking the poor baby in an oven, I take a
ventilation fan, the kind you put on the floor on a hot day, point it
straight up, and set the radio on top of it. I then leave the radio
drying for about a day. This won't work if you have a power
transformer in there, especially a high-voltage one, as I found out
one day, when I fried a perfectly good DX-40 transmitter. I should
have used the oven on that one. But with the oven, you have to be
quite careful, not to generate enough heat to melt any plastic dials,
etc....

From comments I've seen, more people actually prefer the 2-line elements. For one they take up WAY less space when trying to exchange them over packet links. Also, most of the current tracking programs have the ability to directly digest the 2-line elements and automatically update your entire satellite database. For those who absolutely need the long-form elements, there is a small program called "eletrans" that converts the 2-line elements into the standard human-readable output.

I also appreciate the postings. I forward them locally to a few packet BBS's and I'm always receiving comments to the effect of "more, more!" :-)

I have a distinct bias towards experimentation rather than contesting or DXing so I may be out of step with a lot of folks on here. I think of amateur radio basically as a place where one can learn through experimentation and self study about electronics and radio. Amateur radio led me directly into my professional work in broadcasting. I would hope for an amateur radio that can lead other young people into technical careers.

The problem with amateur radio today, as I see it, is that the entrance requirements are no longer relevant to the type of electronic communications that people are interested in today. This is the primary reason that I support a no code license. When I was first licensed in 1964, I struggled through the code because it was one of the two major modes of communications in amateur radio. The other mode was AM. AM is mostly gone. Today the code is only one of a multitude of communications methods used in amateur radio and is hardly used at all in the VHF/UHF bands, except by a few DXers. Most of the experimentation with new modes and techniques is happening at VHF/UHF. Packet, fast scan tv, digital voice mailboxes, satellites, radio control, spread spectrum, digital video, and many other techniques are being spawned and being used at VHF/UHF/SHF. To me, this is where the excitment in amateur radio resides.

I believe that amateur radio can have a bright future with many different interests being represented. I expect that digital techniques, of which

today's packet is just a forerunner, will be a major part of amateur radio just as it has become a major part of all electronics. I don't expect it to become the sum of amateur radio however, radio communication is too broad a field for one technique to dominate. I expect to see cellular techniques adapted for mobile amateur use. I expect to see an increasing interest in amateur video including slow scan, fast scan, and new high definition techniques. We have the spectrum to do some groundbreaking experimentation in leading edge techniques. What we must have is the critical mass of people who are excited by these techniques and have the motivation to experiment with them.

I believe we can no longer promote amateur radio as a way to "Work the World". With competition from cheap long distance phone networks and from cellular telephone, working the world doesn't seem the big deal to today's youth as it did to me twenty six years ago. The world no longer seems the mysterious place it did then. Television satellites have made the world a global village with routine live pictures from all over the globe available every night in our living rooms. We must present amateur radio as the place to be to play with all the exciting new toys of the electronic age. One of the most painless and effective ways to get people to learn is to get their interest in doing something up, then they will seek out ways to learn what they need to know to play. Kids who are interested in baseball can spout endless facts and statistics about the game, not because they were required to learn them for a test, but because they were curious and wanted to know. Similarly, if a kid is excited about some facet of radio, he will learn all he can about the subject, not to pass a test, but because he wants to know. I hope we can fasinate these kids with the neat new things we're doing with radio without turning them off with too much historical baggage.

I think we should modify the written test in the following way: send the questions in CW at 5 WPM. Then if you can copy, you can answer the questions. Perhaps, for many, this would be the same as a place out in the country we like to call "hell".

>None of your points constitute valid arguments against a codeless license,
>although you are perfectly free to promote voluntary proficiency in or
>use of CW by anyone who will listen.
>
>Phil

I read the Reply Comments and the string that followed. Most technical rebuttals were re-rebutted. However, there were rebuttals that dealt with more practical aspects of the hobby that went unanswered. I'm pursuing one of them here: "DSPs on every Bench".

Phil's love of DSPs makes me want to believe that this may be a magnet we need for this hobby. DSPs bridge the gap between computers and communications, especially radio. If we can get enough of the basement PC hackers to take up DSPs and a Novice license, higher usage of all Amateur frequencies is likely, but especially [vus]hf, which would help the WARC situation.

What I know of DSPs would fit on an index card. How do laymen discover how to use this technology, or is it only for the wizards at Bellcore :-) ? Is there a "DSPers Workbench" ? Are there plug-in cards for my PC ? Are DSPs as easy to program as Apple][Basic ? Do I need a Ph.D.EE to use one effectively :-) ? Given Phil's employer, I suspect that all this comes to him rather naturally. However, the arcane technology and tooling is a barrier to widespread experimentation.

These are the questions, if answered, that could unleash the masses on DSP technology, and maybe (just maybe) one of them might get lucky and invent SSB while the rest of us are puttering with AM.

For the right price I can be located in Wyoming. :-)

Seriously... Fort Collins, Colorado is just a 1/2 hour drive south of the border. Someday if'n I'm bored enough when the band is open, I'll drive up there with my 25W HR2510, mobile, and a stack of postcards. Ought to be fun for a change on the receiving end of the pileups.

Nobody actually LIVES in Wyoming, you understand. It's all barren wilderness.

(Now if someone from Wyoming wasn't going to respond before, I think I probably just got their attention. :-)

Good luck --

2924. Letter from Yaesu about FT411

Newsgroup: rec.ham-radio
Date: 1990-11-09 00:02:03 UTC
From: ajs@hpfcdc.HP.COM
Message-ID: <7880358@hpfcdc.HP.COM>
Source record: 6884

Last June I bought an FT411. In October I wrote a three page letter to Yaesu to share some kudos, gripes, and suggestions about the unit. (Send me mail if you want a copy.) To my surprise I got a very nice, detailed reply from the manager of their public relations department. I'll share some of the highlights.

* Starting with production lot 17, the FT411 is called the FT411E. "The major difference... is improved receiver performance at frequencies far from the amateur band, accomplished not by varactor-tuned filters, but by changing capacitance values in the front end filters..."

* The IF was increased "from 16 to 21MHz". (Curious, I measured mine at 17.3MHz.) The changes to the IF unit are apparently too extensive to retrofit.

* Many of the points I raised "are addressed in new models to be announced soon, such as 15-KHz channel steps, better lamp control (the new models will have both always-on, and 5-second modes), an external 13.8-V jack (new models include a built-in charger!), and simplified keypad locking."

* "...watch for multiple selectable low power steps in new models."

* "The need for a DTMF memory display and better low battery indication are known to the designers, but it is too soon to know..."

* An internal SWR meter is unlikely; perceived need is low.

The reply did not address some of my suggestions:

* How to shift up the center of sensitivity?
* Left side button ergonomics.
* Squelch control too close to antenna.
* Documentation on robustness with high SWR.
* PRI channel locks in unexpectedly.
* More documentation on optimal NiCad use.
* Different beeps going to/from Call channel.

You're taking it all much too seriously. Flaming should be thought of as a
bloodless form of combat sport. Sort of an electronic paintball, as it were.

sell the radios the band is lost to hams.
>
> 5) Keep a low profile! The FCC is sooo overworked, and sooo underfunded
> it's unlikely that they will be doing much about 11 meters any time soon.

They won't be doing anything soon. The solution according to a fellow New
Hampshireite in the current administration is to do nothing long enough for the
QRM on HF to get bad enough for the media to notice it. The congress at the
urging of the administration can then step in with public support and pull the
plug on all, and he says ALL HF transmission. Mr HIGH UP in the POWER STRUCTURE
knows I'm a ham and he said with a shrug that there will be no way to clean
all private use of HF off the bands without including hams. The plan is to ban
ALL private transmission. Then they don't have to go after specific violators
they can just swoop around and RDF the easiest violators..by the thousands..
if necessary and pass out big,and he said BIG fines. No jail..no room, but,and
these are his words...."The fine structure will allow a self-sustaining police
action to continue as long as necessary without departmental fiscal impact."
When I brought up the failure of the drug war he laughed and said "drug dealers
are mobile. They are like rats. They hear you coming and can hide. And they
don't have a lifestyle that can be damaged by big fines. You radio
types live in houses and drive cars that can be attached along with your
paychecks. Your lives can be destroyed by being caught on the air by a van
with a couple of guys and the 'probable cause' of RF coming out of your house."
And then because we went to college together and have been friends for a long
time he said,"Sorry Dickie, we need the room, we need the money and the
pressure from the commercial sector is building. You hams did a great job when
we were young but there is nothing you can do now that is so valuable to the

public that they can save you. I'm really sorry".

Then I asked about VHF/UHF and he thought that was really funny.

Porky said it all...."That's all folks"

>one that I don't know about?

My 'umble opinion is that the Uniden/Radio Shack ten meter offerings are an attempt to cash in on one or both of:

* the sunspot cycle

* the ten meter sideband privileges for novice and tech ops.

I'm not going to buy one... I'd rather buy a five bander so I can concentrate on getting my CW up beyond about 7 wpm. However, when the sunspots go away, I hope to see the street prices of these Unidens drop like a stone, and I hope to be able to pick one up (either used or overstock) for a song. Then I stick it on the shelf for the next time old sol does his thing. Opinions?

I think I have the perfect solution.

Access to the CW part of the spectrum should be permitted only to
those who know the Morse code.

Access to other parts of the spectrum should be permitted only to those
who have the appropriate skills. E.g., only people who can speak
should be allowed to use phone, only people with functioning EME
equipment should be allowed to bounce off the moon, etc, only
people with working 2-meter equipment should get to use that
band, etc.

It's silly to require people to learn the Morse code in order to just
be allowed to talk.

]
]So, are you saying that all automatically controlled 2 meter repeaters
]with an autopatch are not legal?

Autopatches carry third party traffic. Thus, they require a control operator. See 97.115 (of revised part 97) - for discussion see page 10-3 of The FCC Rule Book, 1990 (ARRL).

It is not clear to me, under the new regulations, if the user of a repeater operating above 2 meters can be considered the control operator simply due to control on the input frequency. Under the old rules, the control had to be exerted on a different frequency, which somewhat limited that ability of the user to control
it. I see no prohibition under the new rules to controlling on the input frequency, although the requirement to "use an auxiliary station" for radio control may require another frequency. It is clear to me that an autopatch CANNOT be controlled only via a 2 meter frequency - there must be an auxiliary station, and auxiliary stations can only operate above 1.25 meters.

Anyone know a clear interpretation of this confusing mess (ain't "plain english" rules great?)?

The three open autopatch repeaters in Phoenix, operated by the Arizona Repeater Association, all use telephone control on a separate line than the patch audio line. One of these uses an ACC RC-850 controller, and when we called ACC and asked them about using the second line for patch control, they said they had never heard of anyone doing it. I suspect that most autopatches are illegal and have no control other than on a 2 meter input frequency.

I don't think the FCC would look upon that as being any different than
a radio remote control, since that *IS* what it is. The AUXILIARY rules
must be followed for it, such as frequency limitations.

DEUTSCHLAND-RUNDSPRUCH DES DARC NR. 38/90 VOM 09.11.1990

NEWINGTON:

Das Diplom-Komitee des amerikanischen Amateurfunkverbandes ARRL hat die DDR mit Wirkung vom 03.10.1990 von der DXCC-Laenderliste gestrichen. Dies meldete die Rundspruchstation W1AW am 07.11. QSL-Karten mit den Landeskennern DM und DT bzw. Y2 bis Y9 werden nur noch fuer die Zeit vom 17.09.1973 bis zum 02.10.1990 fuer die DDR anerkannt. Verbindungen ab dem 03.10.1990 zaehlen fuer Deutschland, das heisst wie DL. Die Demokratische Volksrepublik Jemen, 7O, und die Arabische Republik Jemen, 4W, sind ab 22.05.90 in der DXCC-Laenderliste gestrichen und durch ein neues Land Jemen, 7O, ersetzt. Als fruehester Termin fuer die Einreichung neuer 7O-Karten ist der 17.03.1991 festgesetzt. Damit umfasst die derzeit gueltige DXCC-Laenderliste 322 Laender.

HERNE:

Die AMSAT-NA hat die im Herbst geplanten Termine fuer die naechsten ZRO-Tests ueber den Amateurfunksatelliten OSCAR 13 bekanntgegeben. Nachfolgend sind ausser den Terminen fuer Mitteleuropa jeweils auch die Elevation und der Winkel der Miaweisung der Satellitenantennen - der sogenannte Squint-Winkel - genannt. Guenstige Bedingungen liegen vor bei grosser Elevation und geringem Squint-Winkel. Hier die Termine:
24.11.90 um 17:00 UTC, Mode B, 8 Grad Elevation, 4 Grad Squint
01.12.90 um 20:30 UTC, Mode B, 7 Grad Elevation, 8 Grad Squint
15.12.90 um 16:30 UTC, Mode B, 6 Grad Elevation, 5 Grad Squint
22.12.90 um 05:30 UTC, Mode B, 56 Grad Elevation, 24 Grad Squint
22.12.90 um 06:45 UTC, Mode L, 56 Grad Elevation, 13 Grad Squint
Die naechsten Tests erfolgen erst wieder zwischen April und Juni 1991. Es sollen dann auch mehr Tests in Mode L stattfinden. Der ZRO-Test ist ein wichtiges Hilfsmittel zur Ueberpruefung der eigenen OSCAR-Station. Die Teilnahme kann jedem OSCAR-Benutzer dringend empfohlen werden. Ziel ist das Erkennen von technischen Fehlern der Empfangsanlage und die Optimierung des OSCAR-Empfangs. Bildlich gesprochen geht es also um die Ausrottung von "Krokodilen". So nennt man volkstuemlich Stationen, die aufgrund schlechter Empfangseigenschaften ihre Sendeleistung unnoetig erhoehen. Eine ausfuehrliche Anleitung zur Teilnahme an den ZRO-Tests ist in der cq-DL 8/89, Seite 495, abgedruckt. Die Frequenzen sind 145,840 MHz fuer Mode B und 435,945 MHz fuer Mode L.

KIEL:

Der DARC-Distrikt Schleswig-Holstein betreibt auf 10,144 MHz eine Aurora-Warnbake. Sie wurde von DK4VW erbaut und dient als Indikator fuer Aurora-Bedingungen aufgrund von Empfangsbeobachtungen. Standort ist bei DK4LI noerdlich der Schlei.
Bei normalen Bedingungen wird das Rufzeichen DK0WCY dreimal hintereinander gegeben, gefolgt von einem Dauerstrich von drei Sekunden Laenge. Bei schwacher Aurora in Norddeutschland werden nach dem Rufzeichen etwa 15 kurze Striche gegeben. Eine starke Aurora wird durch einen zehn Sekunden dauernden Strich angezeigt. Es ist geplant, die Bake parallel auf einer anderen Frequenz mit wechselnden Ausbreitungsbedingungen zu betreiben.

HANNOVER:

Am 03./04.11. fand in Hannover die diesjaehrige Interradio statt. Zur Eroeffnung konnte der gastgebende Distriktsvorsitzende, Claus Otte, DL3MC, zahlreiche Ehrengaeste und Besucher begruessen.
Die Veranstaltung stand unter der Schirmherrschaft von Ministerialdirigent Peter Kahl vom Bundesministerium fuer Post und Telekommunikation. In seiner Festansprache stellte Kahl die Probleme des BMPT bei der Vergabe von Frequenzen dar. Eine Garantie fuer die Erhaltung der heutigen Amateurfunkbaender koenne zum jetzigen Zeitpunkt auf lange Sicht nicht gegeben werden. Jedoch sei der DARC aufgefordert, sich weiterhin gespraechsbereit zu zeigen.
Unter den zahlreichen Fachvortraegen dieses Tages war insbesondere der Beitrag von Dr. Lothar Wilke, Y24UK, von allgemeinem Interesse. In einem umfassenden Rueckblick zeichnete Y24UK die Entwicklung des Amateurfunks in der DDR von 1953 bis 1990 nach.
Im Ausstellungsbereich war der DARC mit einem grossflaechigen Informationszentrum vertreten. Am Stand des Jugend- und Ausbildungsreferats beschaeftigten sich zahlreiche, zum Teil sehr junge Interessenten mit dem Bohren und Bestuecken von Platinen. Ein besonderer Anziehungspunkt war wiederum der Flohmarkt.
Am Sonntag begann die Vortragsreihe mit einer Diskussionsrunde unter dem Thema: Funkamateure fragen den Vorstand und den Amateurrats-Sprecher. Zu den Fragen der Besucher nahmen der gesamte Vorstand des DARC, der AR-Sprecher, Hans-Christian Schuett, DL9XN, und der Geschaeftsfuehrer des DARC, Bernd W. Haefner, Stellung. Die Moderation lag bei Dr. Horst Ellgering, DL9MH.
Hauptthemen waren die Interessenvertretung des DARC gegenueber der Post und der Industrie sowie die drohende Bandbeschneidung des 70-cm-Bandes und die Betrachtung dieser Problematik unter dem Blickwinkel des wirtschaftlich-oekonomischen Nutzens der betroffenen Funkdienste.
Weitere Fragen wurden zur Thematik TVI/BCI, Leistungsbeschraenkungen sowie zur Belegung des Sonderkanals S6 gestellt.
Zur Bildung eigenstaendiger Interessengruppen entstand eine laengere Diskussion. Der 1. Vorsitzende, Guenther Matz, DJ8BN, stell-

te fest, dass technische Innovationen wichtig seien, um weiterhin den experimentellen Aspekt des Amateurfunks unter Beweis zu stellen. Jede Abspaltung von Interessengruppen sei jedoch ein negatives Ergebnis.
Die Diskussion schloss mit der Erkenntnis, dass diese Runde ein fester Bestandteil der Interradio werden solle.
Mit ueber 11.500 Besuchern hat die Interradio erneut ihre Daseinsberechtigung bewiesen. Dabei wird in den naechsten Jahren sicherlich ein weiterer Anstieg der Besucherzahlen zu erwarten sein.

FUNKWETTERBERICHT: (06.11. von DJ2RE)

Erwartungsgemaess steigen seit Monatsanfang die Tageswerte der Sonnenfleckenzahl und der 10-cm-Strahlung wieder steil an. Nach einer Meldung von Boulder/USA wurden am 04.11. 227 bzw. 156 Einheiten erreicht und am darauffolgenden Tage 266 und 170 Einheiten. Zur gleichen Zeit war die Magnetik auffallend ruhig. Auswirkungen auf die Hoehe der F2-Grenzfrequenz, deren Maximalwerte zur Zeit um 13 MHz schwanken, sind allerdings bisher noch nicht zu erkennen.
Die positive Entwicklung der Sonnenaktivitaet wird voraussichtlich bis Mitte November anhalten. Infolgedessen werden sich im Zusammenwirken mit dem jahreszeitlichen Gang waehrend der zweiten Monatshaelfte die besten Ausbreitungsbedingungen dieses Jahres auf den hoeherfrequenten Baendern einstellen.
Das Niveau des Vorjahres wird vermutlich jedoch nicht erreicht werden, da sehr wahrscheinlich das Maximum des Zyklus 22 - mit einem gleitenden Monatsmittel der Sonnenflecken-Relativzahl von 158,1 - bereits im Juli 1989 auftrat.

Wally Blackburn asks "are there tradeoffs between tighter filters and wider ones ...? "

Yes, Narrow ones get rid of the QRM, but they tend to ring, which makes high speeds hard to copy. I find it easier to learn to ignore the QRM than to copy through the ringing.

Hi:
I saw your posting to rec.ham.radio / info-hams. I have a subscription
to the Spacewarn Bulletin of the World Warning Agency for Satellites.
They list recently decayed satellites in each issue. I'll check the
next issue when it arrives (monthly) and let you know what I find for 5
November (I presume the sighting was in Holland and not in the U.K.
where Guy Fawkes day is celebrated on 5 November with lots of
fireworks).

According KR2Q, a member of the CQ Contest Committee and also a frequenter of the YCCC PacketCluster (tm), Y2 (E. Germany) will tentatively be counted as a separate multiplier for the SSB WW contest *only* (the one just passed). It will not be a separate multiplier in the CW contest at the end of November. Fix those CQWW.CTY files now!

I'd second the suggestion of open-wire line. Also look at G-LINE if
you want UHF.
It is also a common thing for people to use mast-head preamps and
occasionally masthead poweramps. If you use a remote PA on HF,
you will also need remote control of lowpass filters and perhaps
a remote or automatic ATU. Our local club has an ex-RAF radio site,
dry gas pressurised co-ax went for miles over the hillside. It had
a solid Al outer tube, a helical support membrane and a 1/8 inch
solid copper inner. Unfortunately the forestry comission ploughed
drainage channels so it is all defunct.

Source record: 6902

If my memory (grey sludgy type) is OK, I read in an old (1985?) qst
that the ICOM r71 loses its marbles when the lithium cell is shorted
or just plain dead. The writer said that he could not get it re-
programmed in the US, It had to go back to J-land.

No equipment reviews cover this topic. Should we start a listing
here on the net of which sets are at risk ?

In a few years, when the cells begin to fade, some brand names are
going to have a bit of an image problem.

Fortunately for me, I run antiques on VHF and homebrew/surplus on HF, but
other people could become the owners of surprisingly expensive component
collections :-(

How about after-market firmware as a business opportunity :-)

I don't know which brands/models are risky, but I've heard enough
rumours to make me curious. Let's find out so that the odium can be
focussed only on the guilty.

2944. IC-229A/H freq. expansion info

Newsgroup: rec.ham-radio
Date: 1990-11-09 16:20:27 UTC
From: jpd@pc.usl.edu
Message-ID: <18251@rouge.usl.edu>
Source record: 6903

Here's some info on the IC229A/H, (indirectly) from ICOM:

The stock radio has RX: 136 - 174, TX: 140-150, FM only.

When diode D5 (conventional, upright diode on the logic board)
is cut, 118 - 135.995 MHz can be received in AM mode.
[Local reports indicate the audio is acceptable but not as good as,
for example, AM received on a PRO-2004 scanner]

To expand TX to 136 - 174 MHz, locate chip diode D9. Ascertain that
the vertical pair of pads to the right are OPEN. Short the next pair
of vertical pads to the right [with solder, perhaps].

These changes pertain only to the USA model.

Here's some ASCII art to clearify:

I have read in ham magazines that the black variety of PVC is not
suitable for RF applications but the white kind is suitable for
structural use at VHF. One way to test relative RF absorption is to
put samples in a microwave oven and see if they melt.

2949. Re: Dead band antennas for an HT

Newsgroup: rec.ham-radio
Date: 1990-11-09 19:01:41 UTC
From: vail@tegra.COM
Message-ID: <1722@atlas.tegra.COM>
Source record: 6908

In article <610@nih-csl.nih.gov> gmc@helix.nih.gov (Gordon Charrick) writes:

Hello everyone. I just recently bought an Icom 24AT. It's a great little device, especially when you open up the receive range. Anyway, the reason I'm posting is because the antenna that came with it basically stinks. From inside my house I can't hit any repeaters and the reception outside the ham bands (at least in the 138-170 range) is pretty bad. I can barely pick up the fairly strong 162.55 weather station at all. I went over to the ham store last night to find another antenna and they recommended one from Larsen (rubber duck also). They wouldn't let me try it since it was in a sealed bag. I was wondering if any of you out there have any recommendations for dual band antennas for this critter. Also, do all the 24AT's have such lousy antennas or did I just get a bum steer?

The supplied antenna is just about useless on 2m. The 440 preformance is average. It really loses out of band, like for the wx channel. I noticed this as I put the antenna from my u2 on it and noticed a big difference. The supplied dummy load seems to be as good or better then any of them on 800 MHZ.

The local HRO here let me try them all. The one I ended up with is a Diamond "buggy whip". It has really great performance on 2m, better than the larsen and MFJ(??). The 440 performance on all of them seemed about the same in my crude experiements.

The diamond "buggy whip" seems to be a nice antenna but be warned that it is almost 1.5 feet long. Also, being a Japanese antenna it is made for 2m and *430*, not 440. For an HT this didn't seem to be too much of a problem but be careful buying Diamond antennas for UHF. I know people who have been burned by "bargains" on Diamond dual band antennas for base use.

I am posting this for a ham friend who doesn't have net access.
Please repond to me and I will give him the answer.

My friend is currently living in "4 land" and will be moving to
Chicago (9 land) next month. He knows he has to submit a 610 form to
the FCC to change his residence and station address.

Can he check the "change call sign" box on the 610 and get a "9" call
at the same time? (Apparently his "4" call has bad connotations.)

2952. Re: Abbreviation "QAM"

Newsgroup: rec.ham-radio
Date: 1990-11-09 20:11:23 UTC
From: olson@bootsie.UUCP
Message-ID: <33@bootsie.UUCP>
Source record: 6911

Along the same lines, is there (via anonymous FTP or something?)
an on-line list of all the "Q" (and other) codes? I know this
info is available in printed form (and I'll doubtless see it
when I start studying for the Novice exam), but I was hoping
for an on-line version.

I'm slowly working myself up to trying ham radio, and I miss
a lot of information content in this group by not knowing the
code letters. Are they used only in Morse, or do people actually
use those codes when doing voice also?

By the way: yes, I would be more inclined to get into Ham
if I didn't have to learn Morse (I actually want to use packet
radio mostly, maybe phone patching too-- Ham seems like the
last great communications bargain). Not that I mind learning
Morse mind you (it's a challenge, and 5 wpm seems very easy
to attain)-- I keep thinking of situations where knowing Morse
would be useful:

1) If I'm ever thrown in prison, I can communicate secret
messages with the other inmate who knows Morse.
2) If I'm in a plane with the radio out, I could communicate
to the tower by flashing the plane's lights-- assuming
someone in the tower knows Morse.
3) After a nuclear war (when all our electronics will have
been wiped out by the EMP), I having a fighting chance of
building a Morse-code-only radio (can you say, "spark gap?").
4) I like knowing obscure things.

Please take these last comments as tongue-in-cheek, humorous
ramblings of a deranged person and don't pick me apart.

P.S. One final question: What is the minimum license needed
to do packet radio? I know I can pass Novice, and probably
Technician (but not anything with a higher code rate, *sigh*).

Thanks!

-Eric

FT4WC WILL QSL VIA F6GVH.

EAST MALAYSIA, 9M6. N2OO WILL SIGN 9M6OO NOVEMBER 16 TO 30, INCLUDING THE CQ WW CW CONTEST. 9M6NA IS ALSO A CONTEST EXPEDITION BY JE1JKL. SATY WILL BE QRV NOVEMBER 21 TO 26, WITH EMPHASIS ON LF OUTSIDE THE TEST. 9M8MKS WILL BE ACTIVE NOVEMBER 10 TO 12 FROM THE SEANET CONVENTION.

GLORIOSO, FR/G. FR5ZU/G IS RUMORED FOR DECEMBER. YOU MAY REMEMBER JACQUES FROM TROMELIN, JUAN DE NOVA, OR EUROPA. HE LIKES 14256 KHZ LIST OPERATIONS FROM 0100 UTC.

JUAN FERNANDEZ, CE0Z. CE0ZZZ EXPEDITION IS DUE NOVEMBER 10 TO 18. CW, SSB AND RTTY ON 80 THROUGH 6 METERS PLUS AO13. QSL VIA CE3BFZ.

MARIANA ISLAND, KH0. KH0AM BY JE1CKA WILL BE A SINGLE OPERATOR IN THE CQ WW CW CONTEST. TACK WILL TRY TO WORK 33 KHZ UP FROM THE LOWER BAND EDGES, PLUS 10133, 18073 AND 24903 KHZ OUTSIDE OF THE CONTEST OPERATING TIMES.

MOZAMBIQUE, C9. LLOYD AND IRIS COLVIN MAY EXTEND THEIR C9QL OPERATION UNTIL NOVEMBER 18. QSL VIA YASME.

ROTUMA, 3D2. VK2BCH IS NOW ACTIVE AS 3D2XV. TRY 14222 KHZ AT 0400 UTC.

SAN FELIX, CE0X. XQ0X HAS BEEN REPORTED TO BE THE CALLSIGN FOR A SAN FELIX OPERATION NOVEMBER 15 TO 20. QSL VIA CE3ESS.

VATICAN, HV. HV35SJ WILL BE ACTIVE NOVEMBER 13 TO 18 WITH N6AR AT THE PADDLE. LARRY PLANS MOSTLY CW ON 80 THROUGH 10 METERS. QSL HV3SJ VIA I0DUD.

WEST MALAYSIA, 9M2. 9M2HB WORKS SSB ON 80 THOUGH 10 METERS. TRY 14222 KHZ. ROSS, 9M2AX LIKES CW ON 40, 20 OR 10 METERS AROUND 1200 UTC.

TP5HA. A SPECIAL CALLSIGN CELEBRATING THE MEMBERSHIP OF HUNGARY IN THE COUNCIL OF EUROPE WILL BE USED NOVEMBER 6 TO 18 ON CW AND NOVEMBER 23 TO 25 ON SSB. QSL TP5HA VIA F6FSQ.

YJ0ARW IS ZL1AMO. LOOK AROUND 1200 UTC ON 20 CW AND 2200 UTC ON 10 CW. QSL VIA ZL1AMO.

THIS BULLETIN WOULD NOT BE COMPLETE WITHOUT OUR CONGRATULATIONS TO THE HK0TU MALPELO TEAM, AND THE LCRA, FOR A VERY SUCCESSFUL EXPEDITION. FELICITACIONES Y MUCHISIMAS GRACIAS AMIGAS POR SU TRABAJO ESPLENDIDO.

2956. Re: re Code & Other requirements

>
>--Phil Howard, KA9WGN--

According to International agreement, all HF users must demonstrate proficiency in morse code. Since all US amateurs can use the HF bands, then all US amateurs knew the code at one time or another. This is the "watering hole" I'm talking about. If you've forgotten where the watering hole is, then I hope you never have to talk to anyone there. i.e. I hope the mic and/or speaker on your HT never flake out when you really need it.

I don't think the rules say "proficiency only when the test is given", but I've never tried to split hairs that closely. I don't think the FCC would yank someone's license if they've forgotten their code element. If that's true, there are a lot of OFs with sexy, short calls in serious trouble.

Perry / KF0CA

2957. Packet DX

Newsgroup: rec.ham-radio
Date: 1990-11-09 23:24:39 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1990Nov9.232439.21818@ux1.cso.uiuc.edu>
Source record: 6916
Cross-posted to: rec.ham-radio.packet,rec.ham-radio

((While this subject relates to packet, it is crossposted since))
((the nature of the question could impact non-packet operators.))

There are nationally and internationally recognized frequencies for DX purposes for Morse Code (CW) and voice (usually SSB) modes in the VHF and high bands. For example: 432.100, 1296.100, 2304.100 MHz

I'd like to know if there are any specially designated frequencies, or if anyone would like to have some so designated, for DX-ing on VHF and above in packet modes?

Clearly, use of the frequencies for Morse or voice DX won't go over very well as there will be lots of mutual interference, usually with the CW/SSB modes suffering. Using FM simplex calling frequencies is out. Except for some on 2 meters, there doesn't SEEM to be a national (USA) plan for packet simplex that is actually used in all areas (tell me if you know otherwise).

Should a packet DX frequency be designated from within packet subbands or from DX subbands?

Should there be different frequencies for different baud rates?
1200?
2400?
4800?
9600?
19200?
56000?
1544000?
10000000?

Should packet DX-ers coordinate on another voice frequency first as is a common practice by ATV DX-ers who use 144.340 FM to make contact before trying video? Should it be only on certain bands?

Packet DX could be a very interesting form of operating. Packet DX can make use of many of the short band opening propogation modes that usually go missed by manually operated modes such as Morse and voice. Challenges include how much data one can pass through a band opening before it closes again (maybe within seconds).

Place a cup of water in the oven with the PVC but not touching it.
Some microwave ovens can be damaged by "unloaded" usage, and others
could shutdown the RF when high reflection (no load) occurs.

If the water boils and the PVC doesn't get hot, it should be OK.
If the PVC melts before the water gets hots, don't use that kind.

>line would be, I jumped in and sarcastically added "146.52".

>He matter-of-factly requested "What's the offset?".

>I just reached down and turned the radio off in disgust.

While travelling to the Dayton Hamfest, I used to check in on the
145.250 wide area repeater in Indianapolis since it was reachable
for the bulk of the trip. I wanted to just stay on the same
frequency. There were lots of LIDS, too.

I soon discovered that I could use not only 146.52 simplex, but
many of the other frequencies near it (146.46 and 146.58 are popular)
for talking to fellow hams on the way to Dayton. The return trip
is also great for this.

Strange, I was able to keep in contact with them through the WHOLE
trip, not just while near Indianapolis. Seems simplex is a WIDE
AREA frequency. :-)

For the right price I can be located in Wyoming. :-)

Seriously... Fort Collins, Colorado is just a 1/2 hour drive south of
the border. Someday if'n I'm bored enough when the band is open, I'll
drive up there with my 25W HR2510, mobile, and a stack of postcards.
Ought to be fun for a change on the receiving end of the pileups.

Nobody actually LIVES in Wyoming, you understand. It's all barren
wilderness.

(Now if someone from Wyoming wasn't going to respond before, I think I
probably just got their attention. :-)

Good luck --
Alan, N0MFW

Won't work Alan. I tried it. As soon as I crossed the state line the
wind started blowing about 70 MPH and the signals on 10 all faded out.

Source record: 6922

/ hpfcso:rec.ham-radio / cep@cci632.UUCP (co-op) / 9:16 am Nov 8, 1990 /
15 meters is my favorite HF band. (I reserve the right to change my
mind about this depending on propagation from month to month :-)).

Why isn't there the equivilent of a 2510 for 15 meters? Or, is there
one that I don't know about? Seems to me it wouldn't be that much
harder to build than the 10m one, and you could leave off the FM
portion and just leave CW, USE, and LSB (packet)

Anybody know anything about NCG attempting this back in the early 80's?

Chris/WZ2B

Kantronics sold one a couple years ago. Evidently business wasn't too
great as they gave up on them.

>the FCC to change his residence and station address.

>Can he check the "change call sign" box on the 610 and get a "9" call
>at the same time? (Apparently his "4" call has bad connotations.)

YES!

Once upon a time the call was changed for a move across call areas
no matter what you wanted and folks like W2NSD/1 just never "moved"
and operated portable for a long, long, time.

If you feel the call you have been assigned is offensive in some way,
but are not moving, just fill out a 610 as if you were getting a
call change for some other reason, and attach a letter explaining
why you believe the call sign is offensive. The rumor I have heard
in more that one place, including here, is that the FCC will just go
ahead and crank it through the system and you will get another call
sign from the assignment sequence for your class and call area.

>It is not clear to me, under the new regulations, if the user of a
>repeater operating above 2 meters can be considered the control operator
>simply due to control on the input frequency. Under the old rules, the

Part of the problem in understanding the rules is that the rules don't directly designate what kind of station any particular station is. For instance what do you have to do to make your station into an auxiliary station? Actually NOTHING. If what you are doing REQUIRES that it be done via an auxiliary station, then think of your station as an auxiliary station and FOLLOW THE AUXILIARY RULES (read 97.201(a)-(e)).

>control had to be exerted on a different frequency, which somewhat limited
>that ability of the user to control
>it. I see no prohibition under the new rules to controlling on the
>input frequency, although the requirement to "use an auxiliary
>station" for radio control may require another frequency. It is

Just "BE" an auxiliary station. There is nothing that says the auxiliary station cannot ALSO be feeding the voice or data input to a repeater in addition to controlling the station.

>clear to me that an autopatch CANNOT be controlled only via a 2 meter
>frequency - there must be an auxiliary station, and auxiliary stations
>can only operate above 1.25 meters.

For those too shy to read the FCC rules, or for those don't have a copy (shame shame shame) I will list the auxiliary frequencies:

220.5 MHz to 225 MHz
420 MHz to 431 MHz
433 MHz to 435 MHz
438 MHz and all ham bands above

>Anyone know a clear interpretation of this confusing mess (ain't
>"plain english" rules great?)?

They are not "plain english" rules. That was defeated many years ago when the FCC proposed them. They proposed rules somewhat like what you see in Part 95 now.

To me the clear interpretation is to consider what way a station is operating and if that operation is violating any rules?

If I am remotely controlling another station, then my station MUST be an auxiliary station. 97.201(a)-(e) are rules that affect such a station.

Let me tell you about a setup I am currently planning, and why I believe it is legal. I am planning a full duplex autopatch system that is not a repeater and will not be attached to one in any way. The input frequency will be (tentatively, pending coordination) 445.725 MHz. The output frequency will be (tentatively, pending coordination) 145.725 MHz.

1. The base station that is transmitting on VHF will be an ordinary station that will be under remote control and will be passing third party traffic.

2. The "user" station will be remotely controlling the base station and will be doing so as an auxiliary station on a frequency authorized for auxiliary stations.

3. Third party traffic rules (97.115) place restrictions on the station that passes third party traffic, such as requiring the control operator to be at the control point. Other restrictions include limits on who the third party may be. You cannot call up an amateur whose license was revoked or suspended, for instance.

4. 97.213(a), by virtue of defining a radio link between the control point and the station under control, allows the control point to be remote from that station. Thus the "user" of the autopatch will be the control operator, and the location of his station will be the control point. The radio based control link must use an auxiliary link.

5. 97.113(e) specifically prohibits retransmission of signals from a radio station with certain exceptions that include amateur stations. The fact that the base station retransmits on VHF that which it receives from an amateur station on UHF is simply retransmission. This differs from a repeater station which is automatic (see 97.3(a)(34)) since the autopatch will be under remote control of a control operator. It won't have to prevent the input from coming through the output.

This kind of autopatch will quite useful from dual-band radios since these can usually operate in full duplex mode (transmit on UHF while receive on VHF). Hopefully there will be sufficient net loss of audio from the base receiver to transmitter that feedback will not occur, though a headset type usage would be ideal. Not everyone around here (Urbana-Champaign, Illinois) has dual-band capability yet, but I know of a few who do (ka9wgn, kb9ffk, wb9oih, wb9ykv).

If you happen to believe that above setup is not legal, I would suggest you review the rules solidly before suggesting that it is not, because I have gone over them very thoroughly already for this project. I've also gone over the rules a lot for other purposes (filing codefree petition, etc.).

While I am not a communications lawyer or such, that doesn't keep me from reading the rules that apply to my own operation and making my own decisions (which is ultimately my responsibility anyway even if I do consult a lawyer) for myself.

25 watts SSB gets you all over the world on 10m, but not so on 15m. Even the
100 watts from my 735 gets stepped on on 15m SSB, particularly when I'm
mobile. This would be my answer: you need more power than a little Uniden
unit would provide.

>>irrelevant baseband modulation example"), spend the 6 hours or whatever
>>learning it, and then get on with being brilliant.
>
>I repeat a point I made in the past. Morse is a marketing disaster.

I agree. I think we shoot ourselves in the foot, too.

Here's my modest proposal: provide (small) code-free [vsu]hf subbands.
If they turn into glorified CB bands, then don't give them any more
bandwidth. If they turn into real technology mills, then expand them.

>I work at an establishment that designs advanced computer networks,
>including hardware, software, protocols, etc. This place is lousy with
>EEs. Yet I have met very, very few people interested in getting started
>in ham radio for the first time.

I work in a similar environment. One person here has been a factor in
five people getting licensed. That's ~10% of the organization.

>Sometimes people begin to get interested. Then they inevitably ask the
>question, "Do you still need to know the morse code?" Given that the
>answer here is still "yes", they immediately lose all interest.
>They just don't want to waste time learning
>an antiquarian skill as a hazing ritual.

The answer is "Morse Code is required of US amateurs by international
treaty. Besides, it is so trivial to learn that that you can do it in 2
weeks by studying 1/2 hr/day." While you may acknowledge their
perceptions, you don't have to agree with them. Two guys here knew they
were being hazed, but then got into the challenge so much, they went for
13 WPM !

For anyone who plays Tetris, or any of those video games, Morse Code is
like making it to Level 5, 13, or 20. I've watched my wife spend hours
trying to hit level 10 / height 6. No difference. She could have been
at 13 WPM by now.

>If you want to communicate,
>the Usenet is zillions of times faster and more reliable than ham radio
>will ever be.

Agreed. But the purpose of ham radio is not efficient communications.
(Boy, am I going to get flamed for that.) The purpose is to _develop_
and _test_ efficient communications (like packet, new modulation

techniques, etc).

>And I'm a CW operator, so don't give me any crap about my own lack of
>effort. I like to _use_ CW. I just don't like to _require_ it.

Then we need to create a VHF-and-up license class. But, if that happens,
I want large Communicator-free subbands. If the usage patterns explode
like everyone predicts, then give them more spectrum. If they behave
like cretins, take away some spectrum.

Info from AMSAT-U:

TELEMETRY OF "RADIO-M1"

Radio-M1 transmits Morse code (CW) and digital telemetry.

CW telemetry will start as soon as the bird separates from
the launch vehicle and Radio-M1 equipment will be powered by
main satellite power system.

CW Morse-Code telemetry frame consists of the registration
call RS14 and 8 four-digit lines in the following format:

RS14 1A 1B 1C 1D
2A 2B 2C 2D
3A 3B 3C 3D
4A 4B 4C 4D
5A 5B 5C 5D
6A 6B 6C 6D
7A 7B 7C 7D
8A 8B 8C 8D

The 1A to 7A lines are analog telemetry data. Line 8A is
calibration engineering parameter.

The first digits from 1A to 8A are system status data:
figure 6 means general operating status
figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are numbers of
line (channel).

The third and fourth digits from 1C to 8D are analog
telemetry datas.

Table of meaning and decoding parameters

No of Parameter Formula Unit

line

0 Transponder power output 0.05N Watt
1 Transponder PA Temperature N Grad. C
2 +24 V Regulated N Volt
3 +16 V Regulated N Volt
4 +9 V Regulated N Volt
5 +24 V Regulated N Volt
6 Inside Temperature N Grad. C
7 Service N *

Example:

RS14
6080 - 4 Watts - general
6137 - 37 Grad. C - general
6224 - 24 Volts - general
6316 - 16 Volts - general
6409 - 9 Volts - general
2524 - 24 Volts - command
2632 - 32 Grad. C - command
2700 - 0 - command

> of my land. I would like to place my antenna at the top of this hill.
> The horizontal distance is about 200 feet. The problem of course,
> is connecting the radio to the antenna. Cable sounds too

Maybe you could try a "passive repeater" setup. This involves
your primary antenna on the hilltop, the cable to the shack, and a
secondary antenna _in_ the shack. A line amplifier somewhere in
between _might_ help, but you would have to find a way to power it.
This type of system is briefly described in the November, 1990
issue of Popular Communications.

2972. Kenwood TH-77A -- mods ?

Newsgroup: rec.ham-radio
Date: 1990-11-10 04:40:53 UTC
From: gwalsh@kilroy.jpl.nasa.gov
Message-ID: <1990Nov10.044053.13684@elroy.jpl.nasa.gov>
Source record: 6682

I've been watching this newsgroup lately and hoping that someone would post mods for this new radio. I just picked one up the other day and so far, so good! The local ham radio store had one on display and they had it modified by someone else to do all the fancy things, including UHF RX to 512MHz and the AM aircraft that Kenwood talks about in their magazine ads. Unfortunately, they don't have the information about how to do this yet. One ham walked into the Kenwood Service Center here and asked them and they said, "TH-77A... That won't be out until next March or April." The ham showed it to the service guy and he couldn't believe it!

Anyway, I'm dying to take advantage of these EXTRA features ASAP, but I still haven't found anyone that knows the mods, so here I am running Pnews today. Has anyone got the answer (yet) ??

Thanks!

```

1. Remember, we're tested on code receiving, not on sending. :-)
2. YOU try doing CW on the undersized keypad of your HT ! :-)
3. Last I saw, ICOM doesn't offer a code key for any of their rice rockets.
Does Yaesu ?

[This is awful, guys. We sit less than 50' apart, and they're hearing
this drivel in Australia. Kinda like 10 meters, I guess.]

>harder to build than the 10m one, and you could leave off the FM
>portion and just leave CW, USE, and LSB (packet)

If you *really* gotta have a 2510 for 15 meters, maybe it's time to dust
off the Handbook section on "Transverters". Shouldn't be too tough,
given the 2510's finals are ersatz-QRP (apologies to Bill) .

I'm curious where on the license it says this. Mine doesn't say anything
like this. I got my first license in 1986 and it didn't say anything then
so I guess they changed it sometime between when yours and mine were issued.

>4) I like knowing obscure things.

In the movie "Young Edison", Edison saves the day by using a train
whistle to signal another train approaching a blown up bridge
that the bridge was out. It turned out that his sister was on
the other train and also knew the "code". She heard her "call",
copied the message (in her head) and told the conductor to pull
the brake line.

Come on, people, if these kids back in those pre-lightbulb
days could do morse, then why can't we today?

>to do packet radio?

Novice or Tech will do it.
Lots of packet on 2 meters. Thats available to techs, but
not Novices. Novices can get on 220 mhz, 1.2 ghz and 10 meters.
On 220 there are packet bbs' here in california. In fact the
bbs that I use is tied up alot on 2 meters but usually open
on 220. Don't know if there is much packet on 1.2ghz. On 10
meters you can run packet too. On 10 you can also run RTTY
and AMTOR. (I think this is correct.) Those modes are a blast,
especially when working DX. The novice license really is
quite useful.

>I know I can pass Novice, and probably
>Technician (but not anything with a higher code rate, *sigh*).

I know what you mean. After getting my tech I worked some
BBSs, then went for the 13wpm code so I could get on HF and
work amtor and rtty on 20 meters.

>Is there a "DSPers Workbench" ? Are there plug-in cards for my PC ?
>Are DSPs as easy to program as Apple][Basic ? Do I need a Ph.D.EE to
>use one effectively :-) ?

There have been DSP kits, and the chips themselves aren't that hard to wire up with a handful of glue I'm told, but most significant is that there will soon be some nice DSP-on-a-PC plug-in cards. AEA and LLGrace are promising one Real Soon Now, and so is TAPR. Each of these is (as I understand it) designed to take the audio output of your receiver and do DSP magic on it. They'll come with some programs to make them act like various kinds of modems, and I'll bet there's a nice subroutine library you can use to make you own.

What I know about DSP is only slightly more than will fit on an index card, but I gained it by going to the library and reading up on it. A pleasant afternoon spent amongst the dusty volumes of knowledge, as it were. When the kits arrive, I'll learn more.

(Warning: gross oversimplifications follow! Those of you who do this for a living just grit your teeth unless I make a real clanger.)

So what's it doing? Well, say perhaps that every 8,000 times a second you measure the voltage coming out of your microphone, then scale that amount into a number between 0 and 255. At the other end, you reverse the process and turn the number into a voltage. That's just simple Analog/Digital/Analog conversion. Your phone and CD player do more than this.

So apply a little bit of DSP cleverness to it: By applying a mathematical formula (a transform) to the stream of numbers, you can convert the numbers from being amplitude-per-unit-time to being amplitude-per-frequency. Then you throw away all the numbers representing frequencies below 300 Hz and above 3,000 Hz, apply the reverse process (an inverse transform), and you've filtered the audio to 300 to 3000 digitally. (There are other ways to do this, of course, but that one's easy to visualize.)

Now say you'd wanted to apply 6db/octave deemphasis while you were at it. All you'd have to do is divide the values in the frequency domain (that's what you got when you applied the Fourier transform) by a number that doubled every time you doubled the frequency.

Sure, it takes some pretty heavy computing - but that's what the chips do for you - it's not like you were entering the numbers into a desk calculator, after all.

Now think about this: you're trying to pick a real weak signal (say, some moonbounce packet) out of noise. Because the signal is digitally created, you know its rate (say it's 1200 baud). Well, you just sample the incoming signal at that rate (or a convenient multiple of it), and look for something that periodically recurs. The noise is essentially random, the man-made signal isn't, so you can just take everything that doesn't correlate with the right rate and pitch it. What you've got left is the proper signal. You can even do this when the noise has peaks that are greater than the desired signal, since you are not discarding them based not on strength, but on periodicity. And if the digital code has any sort of redundancy, you may even be able to restore the bits that were blasted out of existence by the noise peaks. With enough redundancy, you can accurately recover a signal that's completely inaudible to the human ear.

DSP in a nutshell? No, not even. But maybe I've whetted your curiosity? Check out the library! Even the Handbook has some info on DSP.

|>
|> Also, anyone know of a good source of fiberglass tubing for vertical
|> collinear homebrewing?

I own two Diamond antennas for my personal shack use and I love them.
As a trustee for a local repeater, we considered new antenna alternatives. We did not choose Diamond because they would have to be modified for repeater use.
We did not consider mechanical strength or other factors... We did not get that far. The problem with the Diamond or any antenna designed for the "normal" ham is that they do not have a significant amount of down-tilt.

Down-tilt is a term decribing the antennas radiation pattern down rather than up. The problem is that most repeaters are mounted on a tall tower, hill or mountain. If the antenna's radiation pattern does not focus some of the energy down the hill then you could have trouble hearing or activating the repeater when you are under this envelope.

I think this is the most common repeater design failure.

Good Luck,
Phil

=========
SpaceNews
=========

MONDAY NOVEMBER 12, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* ARIANE LAUNCH *
=================
An Ariane launch on 20-Nov-90 will carry two spacecraft manufactured by
GE Astro Space in New Jersey. The two satellites are Satcom C1 for GE
American Communications and Gstar 4 for GTE Spacenet. Final launch
preparations are taking place. The launch window will extend from 6:15
to 9:30 PM EST.

* PACSATs ON-LINE *
===================
The Packet Bulletin Board software which has been running in 'beta test'
versions on UoSAT-OSCAR-14 since July has now been loaded to AO-16. This
follows a period of intense development by Jeff Ward, G0/K8KA, and Harold
Price, NK6K, getting software ready for hundreds of users expected to access
AO-16 and UO-14.

The programs loaded to the satellites, when combined with several ground
station client programs, implement the PACSAT communications protocols
proposed by Jeff and Harold in papers presented at the recent ARRL Amateur
Radio Computer Networking Conference. The protocols provide a connected-mode
file transfer facility called FTL0 and a standard broadcast mode for bulletins
and other items of general interest.

When someone is up or downloading in connected mode you will see packets from
the FTL0 server callsign: PACSAT-0 (on AO-16) or UOSAT3-12 (on UO-14).
Bulletins being broadcast will have source callsigns UOSAT3-11 or PACSAT-11.
These packets may contain some ASCII text, although each will begin with a
short binary header.

The PACSAT protocol suite requires special groundstation software to interpret
binary headers and implement protocol handshakes. Papers in the 9th ARRL
Networking Conference proceedings describe the protocols in detail. Software

for ground stations with IBM-PC type computers will be made available free by UoS through dial-up bulletin boards and on-line information systems.

The release of the ground station software, expected around 8 or 9 November, will mark the official opening of UO-14 and AO-16 for communications by any suitably-equipped, licensed radio amateur. With LO-19 following shortly and FO-20 already providing service, the Amateur Satellite Service will soon have a useful and interesting network of store-and-forward satellites.

* SALYUT-7 NEWS *
==========
The presently unused and long abandoned Soviet space station 'Salyut-7' is tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere in mid-January. Attempts to boost the 60 metric ton structure to a higher orbit have failed. Salyut-7 should produce quite a spectacular light show if it re-enters the atmosphere away from sunlight.

Here is element set 630 for Salyut-7 as released by NASA on 08-Nov-90:

Epoch : 90 310.56350817
Incli : 51.5998
RAAN : 295.9675
Eccn : 3.895E-04
ArgPer : 71.5486
MeanAn : 288.6002
MeanMo : 15.81020057
Decay : 8.7992E-04
Orbit # : 48723

* RS-14/RUDAK-2 NEWS *
==========
Reliable sources within the Soviet Union indicate that the launch of RS-14/RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR requests the help of radio amateurs all over the world to collect telemetry and send it via packet radio or via a SSB net to him. The first day's worth of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on 145.948 MHz SSB and will be vitally important to ground controllers. Later, after ALL systems are working properly on the RUDAK-2 transponder, PSK/BBS/MODE B operations will begin.

2983. Re: DSP workbench

Newsgroup: rec.ham-radio
Date: 1990-11-10 20:07:44 UTC
From: phil@east.Berkeley.EDU
Message-ID: <8734@pasteur.Berkeley.EDU>
Source record: 6693

Perry Scott started an interesting thread on DSP, and I wanted to throw in my two cents. By way of background, I'm a grad student in EE here at Berkeley, working in the DSP group.

Perry asked what to me seems like a crucial question for getting people to experiment with DSP: Are DSPs as easy to program as Apple II Basic? The answer to that question today is a strong "no": today's DSPs typically require programming in rather esoteric assembly languages, and require the programmer to have a good theoretical knowledge of signal processing. Although there are libraries for the various processors, the programmer ends up having to write a lot of code by hand.

That's changing, however. DSP C compilers are available today, and, while they're still not very good, they're getting better. More important, in my opinion, is the emergence of "DSP design environments". For example, our group has developed a software system called Gabriel that is a graphical, block-diagram programming language for DSP. You can design a DSP system by connecting blocks (adders, multipliers, filters, FFTs, I/O, etc.) on the screen. Once the blocks are connected, you can simulate your design on the local workstation, or you can generate assembly code for a variety of DSP chips (currently the Motorola DSP56001 and DSP96002). Gabriel comes with a large selection of pre-defined blocks, and you can add your own. Gabriel also supports block diagram hierarchy, allowing you to define new blocks in terms of connections of other, pre-existing ones, much as you can create one subroutine out of other subroutines in a conventional programming language.

While it still isn't as easy to use as Apple II Basic, it's a step in the right direction: it reduces both the amount of signal processing and assembly language knowledge you need, and is faster and easier than cranking out assembly code by hand.

Unfortunately, Gabriel is written in Lisp, and requires something like a Sparc-1 with 16 MB of memory to use. But as hardware prices fall and performance increases, it may not be that long before homebrewers are able to afford that sort of setup.

Source record: 6694

For those who missed it, the un-net happened today,and we had 5
"checkins" that I know of: John, NJ7E; Gary, KE9ZM; Mike, KB9BLY;
Phil, WA4DDE; and myself (N7IKQ). I could hear every one of you
folks, sorry I could only talk to John and Phil... I really MUST
get that license upgrade, followed closely by a linear...

So, no promises that I'll be on next week, but don't let that
stop others from "checking in" to the un-net!

(I suppose most of you were busy with the contest? Eh? Well, ok,
I'll mention that I joined in long enough to get 2 people who were
contesting: OK5R and Y42OK.... I hope that all of you contesters
did better than I in that regard!) :-)

I believe that recent changes in Part 97 have made remote
control on the repeater input legal.

HOW TO RECEIVE APT PICTURES FROM THE NOAA SATELLITES

So you have decided you want to receive the NOAA and Russian METEOR orbiters and you have a radio that receives 137.500 MHz and a computer. So now what do you do? I hope this short dissertation will steer you in the correct direction.

To display a picture from the orbiting birds you need several things. First you need to 'acquire' the satellite. This means you need the program to calculate its position at any time and determine if you can hear the signals from the 'bird'. The best place to get this program is probably AMSAT-NA an organization dedicated to AMateur SATellites. They have several very good tracking programs for the IBM and also for Commodore and Apple as well. After you have acquired the program and have it running on your computer, you then need the Keplerian Elements for the NOAA satellites. These elements as well as some tracking programs are available from the CELESTIAL RCP/M, run by TS Kelso, at 513-427-0674 (Fairborn,OH) and from the Weather Fax and Remote Imaging DATALINK BBS run by Dr. Jeff Wallach, N5ITU as bulletins for some 80 + sets of satellite data. Another bulletin also tells you to what the printed numbers correspond so you can enter them into the computer program. Use the newest elements you can find as the orbiting satellites are subject to forces which change their orbits. If you use Keplerian Elements more than 3 or 4 weeks old, your chances of hearing the bird are reduced.

Once you are tracking the birds you should hear them on your receiver. They will be on 137.62 (NOAA-11), 137.500 (NOAA-10), 137.850 (Meteor 3-2), 137.4 (Meteor 2-16), 137.3 (Meteor 2-17 and 2-18). Now comes the first thing different about NOAA orbiters. The frequency deviation of the FM transmission is about +/-18-20 kHz. This is 4 times the normal deviation of a police call and 1/3 the deviation of the FM broadcast band FM signal. If you receive the signal on the regular communications width of the scanner the light areas of the picture will be noisy and the signal will sound distorted and the picture will basically be useless. If you use the FM broadcast bandwidth (assuming your scanner will let you), the signal will be weak and there may be too much background noise to see the picture.

So what now ? Well there are two ways to fix the problem, find a receiver with the proper I.F. bandwidth filter of 50 kHz, or modify the I.F. of your scanner to about 50-80 kHz. The simplest mod which has been found to be workable is to remove the narrow communications

I.F. filter and replace it with a 0.01 uFd capacitor. This provides for good Wefax pictures from GOES and pretty fair NOAA orbiter pictures. It can of course result in retuning the radio, voiding the warranty and making the squelch not work properly.

The other characteristic of the NOAA satellite transmissions is THEY ARE WEAK. To get good pictures over a large area we have found a pre-amplifier to be essential. A GaAs-FET type can be obtained from various sources at a reasonable price but still about 50-100 dollars. You can also build one for about 25 dollars from plans for a pre-amp for the 2-meter amateur band and tune it to 137.5 easily.

Lastly, but importantly, the antenna can be of an omni directional, uniform pattern type such as a turnstile antenna similar to those used in the FM broadcast reception business but of course tuned to 137.5 MHz. Mount the pre-amp at the antenna if possible. Crooked coathangers on broomsticks have been known to work, and it is not difficult to build the antenna. Of course 2-meter beams with Az/El tracking will do the job well.

Now that you have a nice audio signal from the satellite, what happens next? The audio tone of 2400 HZ which is the carrier tone that is used to carry the picture information (video), must be detected and the video data converted from analog to digital and then displayed on the computer monitor by the software. The hardware and software to do this is available from several sources with more coming along. Several stand-alone boxes are also available that produce some form of computer output either in printed form or on the display. In addition the people on the DATALINK BBS may also have some data to share with you regarding this equipment.

One of the best sources for information is the WEATHER SATELLITE HANDBOOK available from Dr. Ralph Taggart of Michigan State University at 602 S. Jefferson, Mason, MI 48854 for $15.00. Taggart also writes the monthly WEATHERSAT column which appears in '73 Magazine. A must is THE JOURNAL OF THE ENVIRONMENTAL SALELLITE AMATEUR USERS' GROUP - JESAUG - which is published quarterly. It is available for $30.00 per year from the editor, Jeff Wallach, PO Box 117088 Carrollton, TX. 75011-7088 Back issues of the JESAUG are also available.

At the present the simplest software for the IBM is the Elmer Schweittek MULTIFAX software. A hardware kit is available from A&A Engineering which includes the video dectector circuit and A/D converter. Input to the PC is via the game port. If you want to build your own, complete documentation to build an interface circuit on an IBM PC prototyping board is available from H. Paul Shuch, N6TX, for $6.00 - FAXBOARD.

The WEPIX(tm) software and hardware is available from Encomm. It will produce pictures of 1200 lines by 800 samples per line displayed at 640 x 350 pixels in 16 shades of gray or 16 colors using an IBM PC with 640kB, EGA card and at least one 360k disk.

I remember someone asking for GOES info. This is something I got
of the Datalink BBS some time back.

A Low Cost GOES VAS Imaging System for PC/XT/AT Host Systems
John L. DuBois W1HDX

One of the sources of the global cloud pictures which we
see transmitted over the WEFAX channel from the GOES satellites
at 1691 megahertz is the VAS instrument (Visible and infrared
spin scan radiometer Atmospheric Sounder) carried on the same
satellites. This instrument was called VISSR (Visible and
Infrared Spin Scan Radiometer) on the earlier GOES 1,2 and 3
satellites and did not have the extended multispectral
capabilities of the current imagers. We do not see the original
images over WEFAX, however. They have been received, processed
and retransmitted at least twice before making it to the WEFAX
channel.

VAS visible light images of the full globe originate as
14560 lines, each with 15288 picture elements which provides
ground resolution of about 1 kilometer. The idea of receiving
these original images, in full detail before any processing, has
fascinated me since first learning about them. As I will show in
a series of articles, it is possible for an amateur weather
satellite hobbyist to assemble equipment to receive them for
about two orders of magnitude less cost than a $500,000
commercial system.

Even though the cost is within reason, building such a
system is not simple and it is not practical to describe in one
or two articles. Therefore my plan is to present the material in
a series of modest size installments. This will not be a detailed
construction guide and some of the material will be quite
technical. Nevertheless,it is a project well within the capbility
of an advanced amateur or engineering student and I will present
sufficient information, circuits and software to allow
duplication.

This first installment will cover some personal history,
an explanation of the data available from the VAS imager, how
this data is transmitted and the requirements for an antenna and

low noise preamplifier (LNA).

In 1977 I became interested in weather pictures from space as an outgrowth of my amateur radio involvement with AMSAT ... the organization of hams who build and operate amateur communication satellites. I had earlier discovered and listened with fascination to ham conversations from OSCAR-7 and to tones on 137 mhz from NOAA-4, the polar orbit weather satellite. I could not wait to jump into both activities. Within a few months a tangle of equipment was working and I could talk through OSCAR-7 while APT watching pictures of the 20 or so minute pass of NOAA-4 over the eastern United States. These pictures, while thrilling, were also puzzling ... up to that time the only satellite weather pictures I had seen were in the newspaper and they showed a neat, centered, view of the continental United States. The NOAA-4 pictures were certainly not the source of what I had seen. Well, in due course I learned about GOES. Of course ... this was the way to get my own version of the newspaper pictures.

There was a few week delay while I figured out how to build an antenna, preamplifier and converter for 1691 megahertz. Finally everything was working and the first picture, from GOES EAST, was on the screen of a small Tektronix storage scope. Now what was wrong ??? ... there was a quarter of the earth in this picture and, although it was indeed the northeast quarter, the only part of the United States visible was part of New England and it was scrunched into a tiny region in the upper left hand corner. Oh well, what I wanted was probably in the northwest quadrant view. A few minutes later, the northwest quadrant was on the screen. @$!##&*. Now the rest of the United States was visible but it was scrunched into the upper right corner and it was barely possible to separate one state from another.... a far cry from the newspaper photos which had set me off on this pursuit !

This experience was the seed of an effort which was to occupy much of my spare hobby time over the next ten years. The next step was to learn just where the clear newspaper weather pictures of the United States were coming from and why there was little, if any, resemblence to what was coming off the WEFAX images from GOES. After hours of phone calls and questions directed all over the country, I finally obtained a good description of the GOES system and found the answer: high resolution digital image data (after a great deal of handling by NOAA) is distributed to users, such as media wire service networks, who format it for their own purposes. Images in these formats never get even close to the WEFAX network ! So .... I wasn't going to be able to get those newspaper type pictures ... or was I ? .... how about receiving the digital data directly ? Lets see what GOES is really transmitting :

A good overview of the current GOES satellites is found in the "GOES D, E, F Data Book" published by NOAA. GOES carries a wide variety of remote sensing and communications equipment. In addition to visible and multispectral infrared imaging, it monitors the earths' magnetic field, high energy particle flux in the vicinity of the satellite, and x-ray emissions from the sun. In addition a transponder system collects data from remote instrument platforms on the earth and retransmits it to central processing points. Also on board is WEFAX, actually just a facsimile picture distribution system. Any document (not necessarily related to weather, as we ocasionally see) put in front of the camera at Suitland Maryland is broadcast. In addition to all this there are several radio channels dedicated to housekeeping and navigation.

The VAS images are created, visible and infrared simultaneously, by light from the earth falling on a vertical scanning mirror. It then passes through a mirror optical system and filters which focus it on the respective visible and infrared sensors. This is a point focus on small sensors representing an individual picture element. Scanning to form the image comes, in the horizontal direction, from the spin of the spacecraft and, in the vertical direction, from stepping of the vertical scan mirror. The spin is 100 revolutions per minute or 600 milliseconds per horizontal scan. After each revolution the vertical mirror is stepped to bring the next "strip" of earth into view of the sensors. There are 1820 steps of this mirror so the whole image takes 18.2 minutes. There are multiple sensors at the focal point of the optical system so that at each sampling instant of the horizontal scan, two infrared and eight visible samples are taken. For the infrared, the optical resolution is such that these two samples represent about the same region on the earth but they are measuring different wavelengths. For the visible, however, the optics are arranged so that the eight simultaneous samples show a vertical strip of image. In this way, eight lines of the visible image are formed for each spin of the satellite.

A digital multiplexer takes the eight visible samples, the two infrared samples and various other samples of telemetry data and formats them into a digital data stream at 28 megabits per second. The data is four-phase modulated (QPSK) on a carrier at 1681.6 megahertz and transmitted to earth through a small 18 db gain parabolic antenna. This antenna is "despun" or fixed in attitude while the rest of the satellite spins under it so that it can be precisely pointed at the earth. This transmission of 28mbps QPSK data at 1681 mhz is quite difficult to receive. So difficult in fact, that it was never planned in the overall GOES mission for direct distribution users to receive it. Instead, a more "user-friendly" signal called SVISSR (Stretched VISSR) was designed into the system. This is essentialy the same data sent at a lower data rate (2.11 mbps) which greatly eases the burden

on direct users. Stretched VISSR, or more correctly now, stretched VAS, is the signal which a handful of professional, government and university users around the world pick up to obtain high resolution digital image data from GOES. SVAS, then, is our objective. If we can find a way to receive and process this signal, we will have the very same data and images which are used to generate WEFAX products as well as many other images for professional weather applications.

The details of how all the image samples are formatted for transmission by SVAS will be described in next article. We must first discuss the radio signal in order to determine the equipment necessary for reception. SVAS is transmitted at 1687.1 megahertz. The data stream is modulated onto the carrier as bi-phase modulation (BPSK), 0 and 180 degrees. The data bit rate is 2.11 megabits per second. The spectrum of this kind of a signal is wide band compared to WEFAX. It consists of a broad spread of power between nulls at the carrier frequency +/- N times the bit rate. Figure 1 shows a typical SVAS spectrum. The broad peak in the middle is from the SVAS signal. Its power spectrum continues on either side of this peak in a series of nulls and additional smaller peaks which are largely hidden in the noise in this picture. (The two sharp peaks on either side of the middle are other transmissions. The one on the right is the WEFAX signal at 1691 MHZ.) There is a barely visible notch at the exact middle of the SVAS spectrum. This is the carrier frequency point but the notch confirms a theoretical property of BPSK modulated signals ... the carrier is absent. This gives BPSK a high efficiency, power is not wasted in a transmitted carrier. (The notch does not go to zero on the spectrum display because of limited resolution.) It is necessary to include at least the central "lobe", which is 4 MHZ wide here, and preferably the first two "side-lobes", which would require 8 MHZ, in the receiver bandpass order to preserve signal quality. Quality, expressed as signal to noise ratio (S/N), is precious in a SVAS system and it must be preserved at every possible point.

So we have a wide band signal at 1687.1 mhz ... how weak is it and what will be needed for a receiver? Well, we must consider the antenna and LNA before the receiver or any data processing. It will turn out that these components will make or break the whole system. We can do a few calculations, look at the requirements they produce and decide to go on or quit right there. The major problems in duplicating a SVAS system are likely to occur here.

Now it is necessary to get technical. The following equations provide the tools to determine whether the space and resources you have will allow SVAS reception. The signal to noise ratio (S/N) at the receiver input is expressed by equation 1.

S/N = (EIRP)*G / (K*T*B*L) 1)

Where: S = unmodulated signal power
EIRP = effective isotropic radiated power from GOES
G = receive antenna gain
L = path loss at channel frequency
K = Boltzman's constant
B = channel bandwidth
T = equivalent receiver input noise temperature

S/N can also be expressed as the the ratio of energy per data bit to noise density by equation 2:

S/N = R*Eb/B*No 2)

Where: R = bit rate
Eb = energy per bit
B = channel bandwidth
No = noise density

We can find published curves for a perfect demodulator which relate Eb/No to the bit error rate. The bit error rate is a better quantity than Eb/No to specify because it describes what we really care about ... data errors. So we will use these curves to get Eb/No for equation 2.

Now set equations 1 and 2 equal, eliminating S/N, to obtain G/T as equation 3. G/T describes the performance required of the system "front end" under a given set of channel and transmitter parameters for the desired bit error rate. Equation 4 converts this to decibel form. An additional term M has been added to equation 4 to account for miscelaneous losses such as feedline, polarization loss, etc.

G/T = (Eb*R*K*L) / (No*EIRP) 3)

G/T = Eb/No db - EIRP dbm - K dbm + L db + 10 log R + M db 4)

Typical values of these parameters for GOES VAS are:

EIRP = 55 dbm
L = 189.3 db at 1687 Mhz
K = 198.6 dbm
Eb/No = 10.6 db for Pe = 10E-6
R = 2,110,360 bits/sec --> 63.25 db
M = 3 db

We plug these numbers into equation 4, and obtain 12.5 db as the required G/T. This may be related to antenna size and LNA performance by making a few realistic assumptions:

a) Antenna noise temperature = 70 K
b) LNA gain and receiver noise temperature are adaquate for the LNA to control overall noise temperature.
c) Antenna feed efficiency = .55

Now we tabulate the results for some common antenna sizes. The "maximum" figures are the largest these quantities can be and still maintain a 10E-6 bit error rate:

Antenna Dia.	Maximum Antenna Gain	Maximum System Noise T	LNA Noise Temp.	LNA Noise Fig.
24 ft.	40 db	562 K	492 K	4.3 db
18	37	282	212	2.4
16	36	224	154	1.8
12	34	141	71	.95
10	32	89	19	.28

The "bottom line" of this table is how good the LNA must be for each antenna size. We can pick the antenna likely to get past our budget, wife, zoning board etc. and then see what is required for an LNA. There is a little, ... very little, padding in the assumptions from the M (miscellaneous) factor but this will disappear fast in connectors, cables, pointing error etc. etc. I can assure you from experience that the table is not just fancy theory. It means what it says, there will be no pictures, or very poor pictures, with a 12 foot antenna if the LNA noise figure is much worse than 1 db !

Fortunately, the television satellite receive only (TVRO) industry, although not as healthy today as it was two years ago, has provided us with a good source of antennas. It is relatively easy to obtain TVRO antennas at modest cost up to 16 feet in diameter. The LNA required for a 10 foot diameter is clearly impractical but 71 degrees, as required for a 12 foot antenna, is within reach of modest cost commercial LNAs. Practical amateur LNA designs would probably fall in the area of 154 degrees and require a 16 foot diameter. Therefore we can conclude that the necessary GOES SVAS antenna size is in the range from 12 to 16 feet diameter. We must watch out for a sneaky assumption in the table, however: the LNA gain must be high enough to control system noise figure. This means that single stage (typically 14 db gain) designs will normally not be adaquate. For example, if the LNA has a noise figure of 1 db (75 deg. K) and a gain of 14 db then when used with a downconverter which alone has a noise figure of 6 db (864 deg. K) the overall noise figure will be 1.4 db (109 deg. K). This is a degradation of 34 degrees K in noise temperature which could make the differnce between good and poor pictures with a 12 foot antenna. A minimum of two stages with about 30 db gain is required for the LNA to control the overall noise figure with most downconverters.

To summarize, you will need a 12 foot diameter dish antenna with a very good LNA (probably not home built) or a 16 foot diameter dish with an LNA which could possibly be home made.

Since GOES is a geostationary satellite, any of the commercial mounts made for TVRO satellites will be quite suitable. The feed horn cannot, of course, be the same as for TVRO but that is no problem. The very same feedhorn designs we have been using for years on WEFAX are inherently wideband designs. They will work as well for for the SVAS signal at 1687 MHZ as for WEFAX at 1691 MHZ. I will give a design in the next article for such a feed horn but these designs have been published many times in the WEFAX literature. Figures 2 and 3 show my antenna system. It is a 13 foot diameter dish made by Hero Corporation in Hileah Florida. The aluminum feed horn is the design I will be presenting next time. The mount is an old azimuth-elevation type made by KLM Corporation for TVRO. It is no longer in production, but az-el is really not necessary, I simply had it on hand.

I will not be giving circuit or construction details for the LNA. It is a difficult, tricky, matter to build a LNA with a true noise figure less than 1 db at 1687 Mhz, even for professionals. It was almost impossible ten years ago, and just hard now. (This fact, by the way, is the reason most literature assumes amateurs will not be building VISSR or VAS receiving systems. Fifteen to twenty years ago when the GOES system was designed, LNAs of the quality possible now did not exist and it was absolutely necessary to use an antenna of 24 feet diameter or larger. It seemed inconceivable that amateurs would build these. Of course there is ham "EME", but that is another story.) Consequently, I would suggest that the best approach is to purchase a suitable LNA. One company, Wilmanco, (19529 Business Center Drive, Northridge California 91324) has available a model 1687LNA for about $700.00. An example of an LNA design which could be home built appears in QST, August 1984, page 65. Another example appears in VHF Communications, Volume 3-1984, pages 130-136. The latter article presents a single stage low noise LNA as well as a two stage design with higher noise. For these designs to be effective, the two separate LNA's should be cascaded ... an approach which could also be used with commercial single stage LNA's such as the Microwave Modules MMG1691. Again, however, building and sucessfuly adjusting a two stage LNA is not recommended unless you have specific experience in this area. The LNA in my system is the Wilmanco and it is mounted in a housing at the rear of the horn feed. The LNA must be mounted here. If you put more than 1 foot of coaxial cable between the antenna feed and the LNA, you will seriously degrade system noise performance and waste money spent for both the antenna and LNA.

Note Added 1 March 1989:

Since these articles were first written, the situation regarding an adaquate home built LNA has changed substantially. A very satisfactory design which can be home made without elaborate

test equipment or great skill appears in the Spring 1989 volume of the JESAUG (Journal of the Environmental Satellite Amateur Users Group). This design is capable of about .6 db noise figure and simultaneous 36 db gain.

Almost any previously published design for a WEFAX feedhorn for 1691 MHZ, such as the one found in Ralph Taggarts' "Weather Satellite Handbook" can be used for VISSR since the bandwidth of these designs is at least 100 MHZ. The reason that I present another design has to do with the horn material. Previous designs, such as Taggarts', suggest using a 1 pound coffee can for the cylinder. While the dimensions of a standard coffee can are fortuitously good, the plated steel material is not unless it is carefully painted to prevent rust. If you do not repaint or if you casually add just a little, I have found them to rust badly in one to three New England winters. A warmer, more arrid, climate will allow much longer service but in case you don't live in such a locale, the aluminum design sidesteps the rust problem and helps preserve precious S/N ratio. The aluminum can needed for this design is a Zero Corporation #ZTR-81B and semi-difficult to obtain in small quantities. Anyone wishing to build this design should contact the author regarding availability of the can.

The LNA should be mounted as close as possible to the probe in the dish feed horn. This means building a weather resistant housing on the back or side of the feed horn to enclose the LNA and running no more than a foot of 50 ohm coax to the probe. A little cable here, with a few tenths of a db loss, may help the stability of a marginal LNA but any more than about half a db will be sorely missed from system S/N ratio. The LNA output, if it is a two stage design with over 25 db of gain, will be able to drive up to about 100 ft. of 50 ohm coax.

The next link in the system is the downconverter. There are a number of options here, both commercial and homebuilt. Noise figure and gain of the downconverter, while less important than those of the LNA, cannot be neglected altogather for VISSR use. The VISSR signal is centered on 1687.1 MHZ and occupies about 6 MHZ of bandwidth. Fortunately most WEFAX downconverters are sufficiently broadband that there is no practical difference in input tuning for the VISSR signal as compared to WEFAX. A typical input bandwidth is at least 50 MHZ and this will cover both signals easily. The output frequency, however, will not be the typical 137.5 MHZ. There is no receiver in the usual sense in a VISSR system. The output of the downconverter is amplified, filtered to limit the noise bandwidth and fed to a phase detector where the data is demodulated. Therefore the choice of output frequency for the downconverter must be suitable for easy amplification, filtering and phase demodulation. There is

considerable lattitude in choosing this frequency, it can range from about 10 MHZ to 100 MHZ, but a very convenient choice is 70 MHZ. This is convenient because it is used by many radar, television and digital data systems. Parts such as filters, ampilfiers and phase demodulator components are more easily obtained for 70 MHZ than for other possible choices. The downconverter must therefore produce a 70 MHZ output for 1687.1 MHZ input. For homebuilt circuits this is not a difficult design change, simply recalculating the crystal and revising the output amplifier coil or transformer to resonate at 70 MHZ, keeping in mind that the Q should be low enough to allow at least a 6 to 8 MHZ bandwidth. One caution should be noted regarding the choice of 70 MHZ, however. Television broadcast channel 4 occupies the slot between 66 MHZ and 72 MHZ with the picture carrier at 68.25 MHZ. To avoid interference from a strong channel 4, all of the wiring and chassis from the downconverter through the IF amplifier and phase demodulator should be well shielded.

Among commercial downconverters, the Microwave Modules MMK1691/xxxx is a suitable choice in the $275 price class (as of 1987). The xxxx in the model number refers to the IF output frequency. It is usually sold as MMK1691/137.5 with a 137.5 MHZ IF. One of these can be readily modified for 70 MHZ output by changing the oscillator crystal to 89.8333 MHZ, rewinding the two IF output stage coils, and retuning. It can also be ordered, at slightly higher cost, as MMK1691/70 with the modifications already made. Either way the resulting downconverter will have a conversion gain of 25 to 30 db and a noise figure of about 3 db which is fine for VISSR use.

Looking again at signal levels, with a 13 foot antenna, a feed horn similar to that described, "dead on" pointing of the antenna and polarization of the feed horn, you can expect a signal at the input to the LNA between -105 dbm and -112 dbm. The uncertainty comes from possible differences in antenna and feed efficiency, and other miscellaneous losses. With a 25 db or more gain LNA such as the Wilmanco, and 50 feet or less of good coaxial cable such as RG213, the input to the downconverter will be about -85 dbm. With a 27 db conversion gain, typical of the MMK1691/70, the signal out will be about -58 dbm, centered on 70 MHZ.

The next block of the system will be a 70 MHZ IF amplifier to filter and bring this level from -58 dbm up to -10 dbm. There must be reserve for level adjustment so the total gain required is about 60 db. The minimum bandwidth of this amplifier is 4 MHZ at +/- 3 db. The maximum bandwidth is not critical but should be less than 10 MHZ since excess bandwidth here will degrade the system S/N ratio which we are trying to preserve or enhance in every cost effective way that we can. There are a number of ways to obtain the IF amplifier. Surplus equipment available at flea

markets will include radar, television distribution, digital radio or TVRO IF strips which can be used with little or no modification. Commercial amplifiers are of course available with appropriate specifications but these can be very expensive. A third way to go is to build the amplifier yourself. At 70 MHZ, parts layout is not exceptionaly sensitive and if you have had a little experience with RF circuits then this approach is practical. Figure 5 gives a suitable design.

This is a high gain RF circuit and must be built with good RF construction practice. This means short leads, a ground plane under the parts, and good decoupling on the 12 volt power supply distribution. The AGC control will be adjusted to provide about -15 dbm output at 70 MHZ to the demodulator. The maximum gain available is about 65 db which should be sufficient for even a low gain downconverter. The bandwidth is about 12 MHZ, which is larger than necessary but the single tuned response produces a smooth low distortion phase slope at the edges.

Assuming that we now have the 70 MHZ signal at about -10 dbm, the next step is a phase demodulator. This circuit is a little tricky. The binary data has been modulated onto the carrier as BPSK, zeros are sent with the carrier phase unchanged while ones are sent with the carrier phase shifted 180 degrees or inverted. In order to build a practical phase detector it is necessary to have a replica of the exact carrier frequency, however the spectrum of the received BPSK signal has no component at the center to define this carrier frequency. An ordinary phase locked loop, for example, cannot be used since there is no carrier for it to lock onto. There are a number of circuits in the literature which have been devised to deal with this problem and all depend on some kind of nonlinear operation on the signal to recover the carrier. For example, squaring will produce a component at twice the carrier frequency which can be divided by two to yield the desired signal. For VISSR use, a good circuit choice is the Costas Loop.

The Costas Loop is a variation on a phase locked loop which compensates for the lack of carrier, or expressed in another way, it compensates for the phase reversals of the carrier. Figure 6 is a block diagram of the Costas Loop. The input signal is split into two channels and mixed (multiplied) by the local voltage controlled oscillator at zero and ninety degrees phase shift. The baseband output of the mixers is filtered by lowpass filters with a cutoff just above the data rate. These filters are the final determination of overall noise bandwidth. The two channels are then multiplied togather and the output fed as correction to the VCO. Demodulated data appears at one of the lowpass filter outputs and frequency error appears at the other. In a crude way the loop operation can be understood by thinking of the data input to the VCO multiplier as reversing the

correction phase at the proper times to be in step with the carrier phase reversals and therefore fooling the VCO into behaving as in an ordinary phase locked loop. At any rate, it does work and the output from this circuit is the VISSR data stream we want, at 2.11 MBPS. Trying to examine this data stream on a scope, by the way, is an exercise in futility unless it is a storage scope. If you trigger on the transitions with a non-storage scope, sucessive lines will overlay and you will not see individual ones and zeros, just their superposition. This is commonly called an "eye" pattern and is very useful anyway in diagnosing signal quality. The degree to which the center part of the eye is clean and free of any out-of-place transitions is a measure of S/N. For sucessful VISSR pictures, the eye must be at least 80% open, hopefully more.

A detailed schematic of the Costas Loop demodulator appears in figures 7A & 7B. The only part of the circuit which requires care in layout and construction is the 70 MHZ voltage controled oscillator and amplifiers. This section should be built above a ground plane with short leads and good power supply decoupling to prevent any parasitic oscillation. The remainder of the circuit is not critical as long as reasonable rf construction practice is followed.

The lock bandwidth of the loop will depend on 70 MHZ input level and should be adjusted to about -15 dbm. The loop is tuned by observing the output on an oscilloscope while adjusting the VCO with the 10K tuning potentiometer. The loop time constant is about 1 second, so the adjustment should be made slowly. As the VCO approaches 70 MHZ, the output will show a beat frequency which will clearly lock at 2.11 MHZ. It may be necessary to tune to the other side of lock and back up as the lock character is not symmetrical around the lock point.

The raw data stream out of the demodulator contains the combined VAS data and clock which have been exclusive or multiplied togather. The quality of the signal can be judged as described above by triggering an oscilloscope on the signal transitions and adjusting sweep speed for about 2 bit times across the screen. It will be normal to see lots of jitter on the edges but the pattern should be free of noise and stray transitions in at least 80% of the middle of each eye.

The next block of the system is the bit synchronizer to separate the clock and data which have been combined into this bit stream. At this point we are recovering a bit stream in which the data and clock have been multiplied togather. This is a very simple, binary, operation done by an exclusive OR cicuit where the data is one input and the clock is the other. It is done to increase the transmission efficiency. Sending the clock on a separate channel would be wasteful since it carries very little

information, only its phase and frequency. Reversing the process to separate data and clock again, however, is not so simple. The problem is that after the multiplication we don't know readily whether a particular transition belongs to the clock or the data. It is only in the longer term (many bit times) that we can be sure that there have been on average, R, clock transitions where R is the clock rate.

This fact, that on average the bit stream carries a constant clock rate, is the clue to clock recovery. In the frequency domain, if we look at the bit stream on a spectrum analyizer, there will be multiple peaks spaced at the clock rate. A straightforward idea for recovery is to feed the bit stream to a phase lock loop and see if it will synchronize to the "hidden" clock. This almost works. The problem is that except for special cases, even though the spectrum peaks are spaced at the clock rate, there are nulls at the actual clock frequency and its multiples. There are a multitude of spectrum lines for the PLL to lock on, but none at exactly the right frequency ! Fortunately the solution is easy for moderate to high signal to noise ratios. If we feed this bit stream to a nonlinear circuit of some kind (almost any kind) we will regenerate spectrum lines at the clock rate and its multiples. By filtering out the fundamental and feeding this to the PLL, we will have recovered the pure clock. The bandwidth of the PLL must be set low enough to suppress phase jitter from the "random" data transitions but this is not a critical parameter.

A suitable circuit for clock recovery appears in figure 1. The first section of this circuit is simply a filter matched closely to the spectrum of the data bit stream in order to remove noise as far as possible without cutting into the information itself. Following this is an edge detector or differentiator which forms short pulses on the edges of the filtered waveform. For a noise free signal this would produce a "spike" at each edge of bit stream. This is the nonlinear operation which regenerates the clock lines in the spectrum. The pulses are then used to synchronize a PLL running at twice the clock rate. The 2 x clock line is strongest in the regenerated spectrum and most reliable for PLL lock. The PLL frequency divided by 2 then yields the 2.11 MHZ clock we need to synchronize further operations.

In order to complete the process of deriving a separate clock and data stream we must account for the NRZ-S coding of data prior to combination with the clock. NRZ-S coding replaces the original data with a transition, either 1 to 0 or 0 to 1 depending on the original state, when the source data is a zero. If the source data is a 1 then the output stays in its original state. For example a continuous data 1 would produce no output transitions while a continuous data 0 would produce a square wave output at the bit rate. In the VAS case it is this NRZ-S coded

data which has been multiplied by the clock. The HC175 and exclusive-OR gate in the circuit of figure 1 strip off this encoding and produce a clean, separated data output. Additional circuitry in figure 1 examines the data stream for coherence between the clock and provides a signal to indicate whether or not there is valid data coming out. If there is, the "BIT SYNC" light comes on. During normal operation this light will blink out during the 50 millisecond period every spin (600 milliseconds) when the VAS transmitter is turned off.

FRAME SYNCHRONIZER

Now we arrive at something of a problem in planning. The current format of VAS data is organized according to a scheme called "Mode AAA". This specifies the exact placement of telemetry data, image data, and synchronizing bits within the overall flow of data and must be used to comb out the images we want. The frame synchronizer is a very specific, dedicated design which uses the format description to arrive, finally, at individual image bytes which can be placed in an image frame buffer to display the pictures. Unfortunately, NOAA is currently in the process of revising this formatting scheme to another version called "GVAR" to be effective with the launch of the next GOES satellite sometime in late 1989 or 1990. As a result my design for the frame synchronizer, while it works fine today and can be duplicated, will only be valid until the next GOES launch. I will be revising the frame synchronizer design to work with GVAR but this won't be completed until late this year or early 1989. Consequently the remainder of this article will be more of an overview of the circuits and process than in previous sections. If any readers do want to duplicate the mode AAA circuitry I will be happy to provide the circuits and more detailed information.

Once the separated clock and data are obtained at the output of the bit synchronizer, the processing becomes entirely digital. However, the high bit rate, 2.11 MBPS, and the requirement to locate specific patterns in the data stream to identify image boundarys precludes feeding the data directly into a personal computer serial data port. Even "turbo" speed PC's would not be able to ingest this data and separate telemetry from image bytes at the required rate. Fortunately the task can be done simply in dedicated hardware and provide organized image data to the PC from memory mapped onto its own data bus.

The basic frame of stretched VAS data is organized as 12 blocks, each lasting 50 milliseconds. This entire frame, which takes 600 milliseconds, is transmitted during one revolution of the satellite spinning at 100 rpm. The beginning of each block is identified by a unique 10,032 bit pattern in the data. The frame synchronizer must identify a fragment (or all) of this pattern

precisely and then use the identification time as a reference point from which to count out bits and words representing the desired images. Several methods exist for identifying this initial block synchronization word. Digital correlation by integrated circuits such as the TRW 1023 is straightforward but expensive. The method used in the present circuit designs compare the ongoing data bit stream with the output of a PN sequence generator which itself produces the synchronizing pattern. If there is a mismatch, the local generator is restarted. Eventually there will be coincidence between the two patterns and when they have run togather to the end of the sequence, a flag is set for other circuits to begin operating. The local generator is allowed to continue running because the data must be multiplied by this sequence to remove a randomizing function imposed at the transmitter.

The organization of data in the 12 blocks of each line is described in the NOAA/NESDIS publication "Operational VAS Mode AAA Format, Specification SFP 002 - Version 2.2". Each block consists of a general information header giving the block number and other details, and an information field containing image documentation and the image data itself. The frame of 12 blocks contains data for 1 line of infrared image in two different spectral bands and data for 8 consecutive lines of visible spectrum image. There are 3822 ten bit image words in the infrared blocks and 15,802 six bit image words in the visible spectrum blocks. The documentation fields of these blocks contain a wealth of information for calibration, gridding, location of the field of view, orbit parameters, and so forth. There is so much information, not to mention so many image words, that the primary design task for a low cost system is deciding what to eliminate. The principle technique for simplifying the reception hardware and lowering its cost is to select a small portion (512 bytes) of the incoming data which is adaquate for the users purposes and saving only that portion in a cache RAM. At the end of the block there is adaquate time to transfer this cache into the associated personal computer. The cache interface hardware is configurable for selection parameters, mainly the number of consequtive image words to skip, so that different geographic coverages can be achieved. By saving only every 30th image word for example, the entire width of the full globe can be displayed in a 512 byte image line. The actual resolution in this image would be quite low, of course, but when smaller geographic areas are desired, fewer image words are omitted and the resolution is approximately matched to the field of view.

The design of the cache RAM and associated timing hardware will be highly specific to the personal computer selected for data handling and display. The present frame synchronizer circuits are intended to work with the common XT class computer. This interface maps the temporary cache storage into the XT

memory space and issues interrupts at the beginning and end of each data block. The beginning interrupt allows identification of the block and a decision on keeping or skipping that block. If it is to be kept, the data is transfered out of the local memory following the subsequent interrupt and directly into the image frame buffer memory for immediate display of the line. This technique avoids any requirement for extended memory on the main computer bus. Timing parameters are set up through several I/O ports on the interface. In addition to image data, the general information telemetry available in the IR blocks 1 and 2 is extracted, displayed and updated on the XT computer screen once per line.

High speed operation of the computer is not a prerequisite, my system operates at the lowest common clock speed, 4.7 MHZ, and adaquate time is available for collecting 512 data bytes per image line and transfering them to the display memory.

FRAME BUFFER

As in the choice of computer, the choice of a frame buffer for video image display is wide. The conventional CGA and EGA display cards are not suitable for the purpose because their resolution and grey scale are too restricted for satisfactory VAS images. Some of the recent VGA displays will provide 640 pixels x 480 lines at 256 colors/grey shades which is adaquate for some uses. A more satisfactory solution, still at moderate cost, is to use an "image processing" type frame buffer card available from several manufacturers for both XT and AT class computers. The minimum configuration of these buffers is 512 pixels x 512 lines at 256 colors/grey shades and a typical example is the AT&T TARGA model M8 in the $2000 price class. This is entirely satisfactory for monochrome VAS image display and allows experimentation with color representation of albedo.

The final consideration in the low cost system assembled around the XT or similar personal computer is longer term storage of the images. The technique described stores the image in the local memory of the frame buffer while it is viewed. If it is to be saved it can be transfered out of the frame buffer onto fixed disk or floppy disk. One 512 x 512 image will require 225K of storage space but this can be reduced by any of the popular "archive" data compression programs to about 150K.

I remember someone asking for GOES info. This is something I got
of the Datalink BBS some time back.

A Low Cost GOES VAS Imaging System for PC/XT/AT Host Systems
John L. DuBois W1HDX

One of the sources of the global cloud pictures which we
see transmitted over the WEFAX channel from the GOES satellites
at 1691 megahertz is the VAS instrument (Visible and infrared
spin scan radiometer Atmospheric Sounder) carried on the same
satellites. This instrument was called VISSR (Visible and
Infrared Spin Scan Radiometer) on the earlier GOES 1,2 and 3
satellites and did not have the extended multispectral
capabilities of the current imagers. We do not see the original
images over WEFAX, however. They have been received, processed
and retransmitted at least twice before making it to the WEFAX
channel.

VAS visible light images of the full globe originate as
14560 lines, each with 15288 picture elements which provides
ground resolution of about 1 kilometer. The idea of receiving
these original images, in full detail before any processing, has
fascinated me since first learning about them. As I will show in
a series of articles, it is possible for an amateur weather
satellite hobbyist to assemble equipment to receive them for
about two orders of magnitude less cost than a $500,000
commercial system.

Even though the cost is within reason, building such a
system is not simple and it is not practical to describe in one
or two articles. Therefore my plan is to present the material in
a series of modest size installments. This will not be a detailed
construction guide and some of the material will be quite
technical. Nevertheless,it is a project well within the capbility
of an advanced amateur or engineering student and I will present
sufficient information, circuits and software to allow
duplication.

This first installment will cover some personal history,
an explanation of the data available from the VAS imager, how
this data is transmitted and the requirements for an antenna and
low noise preamplifier (LNA).

In 1977 I became interested in weather pictures from space as an outgrowth of my amateur radio involvement with AMSAT ... the organization of hams who build and operate amateur communication satellites. I had earlier discovered and listened with fascination to ham conversations from OSCAR-7 and to tones on 137 mhz from NOAA-4, the polar orbit weather satellite. I could not wait to jump into both activities. Within a few months a tangle of equipment was working and I could talk through OSCAR-7 while APT watching pictures of the 20 or so minute pass of NOAA-4 over the eastern United States. These pictures, while thrilling, were also puzzling ... up to that time the only satellite weather pictures I had seen were in the newspaper and they showed a neat, centered, view of the continental United States. The NOAA-4 pictures were certainly not the source of what I had seen. Well, in due course I learned about GOES. Of course ... this was the way to get my own version of the newspaper pictures.

There was a few week delay while I figured out how to build an antenna, preamplifier and converter for 1691 megahertz. Finally everything was working and the first picture, from GOES EAST, was on the screen of a small Tektronix storage scope. Now what was wrong ??? ... there was a quarter of the earth in this picture and, although it was indeed the northeast quarter, the only part of the United States visible was part of New England and it was scrunched into a tiny region in the upper left hand corner. Oh well, what I wanted was probably in the northwest quadrant view. A few minutes later, the northwest quadrant was on the screen. @$!##&⋆. Now the rest of the United States was visible but it was scrunched into the upper right corner and it was barely possible to separate one state from another.... a far cry from the newspaper photos which had set me off on this pursuit !

This experience was the seed of an effort which was to occupy much of my spare hobby time over the next ten years. The next step was to learn just where the clear newspaper weather pictures of the United States were coming from and why there was little, if any, resemblence to what was coming off the WEFAX images from GOES. After hours of phone calls and questions directed all over the country, I finally obtained a good description of the GOES system and found the answer: high resolution digital image data (after a great deal of handling by NOAA) is distributed to users, such as media wire service networks, who format it for their own purposes. Images in these formats never get even close to the WEFAX network ! So .... I wasn't going to be able to get those newspaper type pictures ... or was I ? .... how about receiving the digital data directly ? Lets see what GOES is really transmitting :

A good overview of the current GOES satellites is found in the "GOES D, E, F Data Book" published by NOAA. GOES carries a

wide variety of remote sensing and communications equipment. In addition to visible and multispectral infrared imaging, it monitors the earths' magnetic field, high energy particle flux in the vicinity of the satellite, and x-ray emissions from the sun. In addition a transponder system collects data from remote instrument platforms on the earth and retransmits it to central processing points. Also on board is WEFAX, actually just a facsimile picture distribution system. Any document (not necessarily related to weather, as we ocasionally see) put in front of the camera at Suitland Maryland is broadcast. In addition to all this there are several radio channels dedicated to housekeeping and navigation.

The VAS images are created, visible and infrared simultaneously, by light from the earth falling on a vertical scanning mirror. It then passes through a mirror optical system and filters which focus it on the respective visible and infrared sensors. This is a point focus on small sensors representing an individual picture element. Scanning to form the image comes, in the horizontal direction, from the spin of the spacecraft and, in the vertical direction, from stepping of the vertical scan mirror. The spin is 100 revolutions per minute or 600 milliseconds per horizontal scan. After each revolution the vertical mirror is stepped to bring the next "strip" of earth into view of the sensors. There are 1820 steps of this mirror so the whole image takes 18.2 minutes. There are multiple sensors at the focal point of the optical system so that at each sampling instant of the horizontal scan, two infrared and eight visible samples are taken. For the infrared, the optical resolution is such that these two samples represent about the same region on the earth but they are measuring different wavelengths. For the visible, however, the optics are arranged so that the eight simultaneous samples show a vertical strip of image. In this way, eight lines of the visible image are formed for each spin of the satellite.

A digital multiplexer takes the eight visible samples, the two infrared samples and various other samples of telemetry data and formats them into a digital data stream at 28 megabits per second. The data is four-phase modulated (QPSK) on a carrier at 1681.6 megahertz and transmitted to earth through a small 18 db gain parabolic antenna. This antenna is "despun" or fixed in attitude while the rest of the satellite spins under it so that it can be precisely pointed at the earth. This transmission of 28mbps QPSK data at 1681 mhz is quite difficult to receive. So difficult in fact, that it was never planned in the overall GOES mission for direct distribution users to receive it. Instead, a more "user-friendly" signal called SVISSR (Stretched VISSR) was designed into the system. This is essentialy the same data sent at a lower data rate (2.11 mbps) which greatly eases the burden on direct users. Stretched VISSR, or more correctly now,

stretched VAS, is the signal which a handful of professional, government and university users around the world pick up to obtain high resolution digital image data from GOES. SVAS, then, is our objective. If we can find a way to receive and process this signal, we will have the very same data and images which are used to generate WEFAX products as well as many other images for professional weather applications.

The details of how all the image samples are formatted for transmission by SVAS will be described in next article. We must first discuss the radio signal in order to determine the equipment necessary for reception. SVAS is transmitted at 1687.1 megahertz. The data stream is modulated onto the carrier as bi-phase modulation (BPSK), 0 and 180 degrees. The data bit rate is 2.11 megabits per second. The spectrum of this kind of a signal is wide band compared to WEFAX. It consists of a broad spread of power between nulls at the carrier frequency +/- N times the bit rate. Figure 1 shows a typical SVAS spectrum. The broad peak in the middle is from the SVAS signal. Its power spectrum continues on either side of this peak in a series of nulls and additional smaller peaks which are largely hidden in the noise in this picture. (The two sharp peaks on either side of the middle are other transmissions. The one on the right is the WEFAX signal at 1691 MHZ.) There is a barely visible notch at the exact middle of the SVAS spectrum. This is the carrier frequency point but the notch confirms a theoretical property of BPSK modulated signals ... the carrier is absent. This gives BPSK a high efficiency, power is not wasted in a transmitted carrier. (The notch does not go to zero on the spectrum display because of limited resolution.) It is necessary to include at least the central "lobe", which is 4 MHZ wide here, and preferably the first two "side-lobes", which would require 8 MHZ, in the receiver bandpass order to preserve signal quality. Quality, expressed as signal to noise ratio (S/N), is precious in a SVAS system and it must be preserved at every possible point.

So we have a wide band signal at 1687.1 mhz ... how weak is it and what will be needed for a receiver? Well, we must consider the antenna and LNA before the receiver or any data processing. It will turn out that these components will make or break the whole system. We can do a few calculations, look at the requirements they produce and decide to go on or quit right there. The major problems in duplicating a SVAS system are likely to occur here.

Now it is necessary to get technical. The following equations provide the tools to determine whether the space and resources you have will allow SVAS reception. The signal to noise ratio (S/N) at the receiver input is expressed by equation 1.

S/N = (EIRP)*G / (K*T*B*L) 1)

Where: S = unmodulated signal power
EIRP = effective isotropic radiated power from GOES
G = receive antenna gain
L = path loss at channel frequency
K = Boltzman's constant
B = channel bandwidth
T = equivalent receiver input noise temperature

S/N can also be expressed as the the ratio of energy per data bit to noise density by equation 2:

S/N = R*Eb/B*No 2)

Where: R = bit rate
Eb = energy per bit
B = channel bandwidth
No = noise density

We can find published curves for a perfect demodulator which relate Eb/No to the bit error rate. The bit error rate is a better quantity than Eb/No to specify because it describes what we really care about ... data errors. So we will use these curves to get Eb/No for equation 2.

Now set equations 1 and 2 equal, eliminating S/N, to obtain G/T as equation 3. G/T describes the performance required of the system "front end" under a given set of channel and transmitter parameters for the desired bit error rate. Equation 4 converts this to decibel form. An additional term M has been added to equation 4 to account for miscelaneous losses such as feedline, polarization loss, etc.

G/T = (Eb*R*K*L) / (No*EIRP) 3)

G/T = Eb/No db - EIRP dbm - K dbm + L db + 10 log R + M db 4)

Typical values of these parameters for GOES VAS are:

EIRP = 55 dbm
L = 189.3 db at 1687 Mhz
K = 198.6 dbm
Eb/No = 10.6 db for Pe = 10E-6
R = 2,110,360 bits/sec --> 63.25 db
M = 3 db

We plug these numbers into equation 4, and obtain 12.5 db as the required G/T. This may be related to antenna size and LNA performance by making a few realistic assumptions:

a) Antenna noise temperature = 70 K
b) LNA gain and receiver noise temperature are adaquate for the LNA to control overall noise temperature.
c) Antenna feed efficiency = .55

Now we tabulate the results for some common antenna sizes. The "maximum" figures are the largest these quantities can be and still maintain a 10E-6 bit error rate:

Antenna Dia.	Maximum Antenna Gain	Maximum System Noise T	LNA Noise Temp.	LNA Noise Fig.
24 ft.	40 db	562 K	492 K	4.3 db
18	37	282	212	2.4
16	36	224	154	1.8
12	34	141	71	.95
10	32	89	19	.28

The "bottom line" of this table is how good the LNA must be for each antenna size. We can pick the antenna likely to get past our budget, wife, zoning board etc. and then see what is required for an LNA. There is a little, ... very little, padding in the assumptions from the M (miscellaneous) factor but this will disappear fast in connectors, cables, pointing error etc. etc. I can assure you from experience that the table is not just fancy theory. It means what it says, there will be no pictures, or very poor pictures, with a 12 foot antenna if the LNA noise figure is much worse than 1 db !

Fortunately, the television satellite receive only (TVRO) industry, although not as healthy today as it was two years ago, has provided us with a good source of antennas. It is relatively easy to obtain TVRO antennas at modest cost up to 16 feet in diameter. The LNA required for a 10 foot diameter is clearly impractical but 71 degrees, as required for a 12 foot antenna, is within reach of modest cost commercial LNAs. Practical amateur LNA designs would probably fall in the area of 154 degrees and require a 16 foot diameter. Therefore we can conclude that the necessary GOES SVAS antenna size is in the range from 12 to 16 feet diameter. We must watch out for a sneaky assumption in the table, however: the LNA gain must be high enough to control system noise figure. This means that single stage (typically 14 db gain) designs will normally not be adaquate. For example, if the LNA has a noise figure of 1 db (75 deg. K) and a gain of 14 db then when used with a downconverter which alone has a noise figure of 6 db (864 deg. K) the overall noise figure will be 1.4 db (109 deg. K). This is a degradation of 34 degrees K in noise temperature which could make the differnce between good and poor pictures with a 12 foot antenna. A minimum of two stages with about 30 db gain is required for the LNA to control the overall noise figure with most downconverters.

To summarize, you will need a 12 foot diameter dish antenna with a very good LNA (probably not home built) or a 16 foot diameter dish with an LNA which could possibly be home made.

Since GOES is a geostationary satellite, any of the commercial mounts made for TVRO satellites will be quite suitable. The feed horn cannot, of course, be the same as for TVRO but that is no problem. The very same feedhorn designs we have been using for years on WEFAX are inherently wideband designs. They will work as well for for the SVAS signal at 1687 MHZ as for WEFAX at 1691 MHZ. I will give a design in the next article for such a feed horn but these designs have been published many times in the WEFAX literature. Figures 2 and 3 show my antenna system. It is a 13 foot diameter dish made by Hero Corporation in Hileah Florida. The aluminum feed horn is the design I will be presenting next time. The mount is an old azimuth-elevation type made by KLM Corporation for TVRO. It is no longer in production, but az-el is really not necessary, I simply had it on hand.

I will not be giving circuit or construction details for the LNA. It is a difficult, tricky, matter to build a LNA with a true noise figure less than 1 db at 1687 Mhz, even for professionals. It was almost impossible ten years ago, and just hard now. (This fact, by the way, is the reason most literature assumes amateurs will not be building VISSR or VAS receiving systems. Fifteen to twenty years ago when the GOES system was designed, LNAs of the quality possible now did not exist and it was absolutely necessary to use an antenna of 24 feet diameter or larger. It seemed inconceivable that amateurs would build these. Of course there is ham "EME", but that is another story.) Consequently, I would suggest that the best approach is to purchase a suitable LNA. One company, Wilmanco, (19529 Business Center Drive, Northridge California 91324) has available a model 1687LNA for about $700.00. An example of an LNA design which could be home built appears in QST, August 1984, page 65. Another example appears in VHF Communications, Volume 3-1984, pages 130-136. The latter article presents a single stage low noise LNA as well as a two stage design with higher noise. For these designs to be effective, the two separate LNA's should be cascaded ... an approach which could also be used with commercial single stage LNA's such as the Microwave Modules MMG1691. Again, however, building and sucessfuly adjusting a two stage LNA is not recommended unless you have specific experience in this area. The LNA in my system is the Wilmanco and it is mounted in a housing at the rear of the horn feed. The LNA must be mounted here. If you put more than 1 foot of coaxial cable between the antenna feed and the LNA, you will seriously degrade system noise performance and waste money spent for both the antenna and LNA.

Note Added 1 March 1989:

Since these articles were first written, the situation regarding an adaquate home built LNA has changed substantially. A very satisfactory design which can be home made without elaborate

test equipment or great skill appears in the Spring 1989 volume of the JESAUG (Journal of the Environmental Satellite Amateur Users Group). This design is capable of about .6 db noise figure and simultaneous 36 db gain.

Almost any previously published design for a WEFAX feedhorn for 1691 MHZ, such as the one found in Ralph Taggarts' "Weather Satellite Handbook" can be used for VISSR since the bandwidth of these designs is at least 100 MHZ. The reason that I present another design has to do with the horn material. Previous designs, such as Taggarts', suggest using a 1 pound coffee can for the cylinder. While the dimensions of a standard coffee can are fortuitously good, the plated steel material is not unless it is carefully painted to prevent rust. If you do not repaint or if you casually add just a little, I have found them to rust badly in one to three New England winters. A warmer, more arrid, climate will allow much longer service but in case you don't live in such a locale, the aluminum design sidesteps the rust problem and helps preserve precious S/N ratio. The aluminum can needed for this design is a Zero Corporation #ZTR-81B and semi-difficult to obtain in small quantities. Anyone wishing to build this design should contact the author regarding availability of the can.

The LNA should be mounted as close as possible to the probe in the dish feed horn. This means building a weather resistant housing on the back or side of the feed horn to enclose the LNA and running no more than a foot of 50 ohm coax to the probe. A little cable here, with a few tenths of a db loss, may help the stability of a marginal LNA but any more than about half a db will be sorely missed from system S/N ratio. The LNA output, if it is a two stage design with over 25 db of gain, will be able to drive up to about 100 ft. of 50 ohm coax.

The next link in the system is the downconverter. There are a number of options here, both commercial and homebuilt. Noise figure and gain of the downconverter, while less important than those of the LNA, cannot be neglected altogather for VISSR use. The VISSR signal is centered on 1687.1 MHZ and occupies about 6 MHZ of bandwidth. Fortunately most WEFAX downconverters are sufficiently broadband that there is no practical difference in input tuning for the VISSR signal as compared to WEFAX. A typical input bandwidth is at least 50 MHZ and this will cover both signals easily. The output frequency, however, will not be the typical 137.5 MHZ. There is no receiver in the usual sense in a VISSR system. The output of the downconverter is amplified, filtered to limit the noise bandwidth and fed to a phase detector where the data is demodulated. Therefore the choice of output frequency for the downconverter must be suitable for easy amplification, filtering and phase demodulation. There is

considerable lattitude in choosing this frequency, it can range from about 10 MHZ to 100 MHZ, but a very convenient choice is 70 MHZ. This is convenient because it is used by many radar, television and digital data systems. Parts such as filters, ampilfiers and phase demodulator components are more easily obtained for 70 MHZ than for other possible choices. The downconverter must therefore produce a 70 MHZ output for 1687.1 MHZ input. For homebuilt circuits this is not a difficult design change, simply recalculating the crystal and revising the output amplifier coil or transformer to resonate at 70 MHZ, keeping in mind that the Q should be low enough to allow at least a 6 to 8 MHZ bandwidth. One caution should be noted regarding the choice of 70 MHZ, however. Television broadcast channel 4 occupies the slot between 66 MHZ and 72 MHZ with the picture carrier at 68.25 MHZ. To avoid interference from a strong channel 4, all of the wiring and chassis from the downconverter through the IF amplifier and phase demodulator should be well shielded.

Among commercial downconverters, the Microwave Modules MMK1691/xxxx is a suitable choice in the $275 price class (as of 1987). The xxxx in the model number refers to the IF output frequency. It is usually sold as MMK1691/137.5 with a 137.5 MHZ IF. One of these can be readily modified for 70 MHZ output by changing the oscillator crystal to 89.8333 MHZ, rewinding the two IF output stage coils, and retuning. It can also be ordered, at slightly higher cost, as MMK1691/70 with the modifications already made. Either way the resulting downconverter will have a conversion gain of 25 to 30 db and a noise figure of about 3 db which is fine for VISSR use.

Looking again at signal levels, with a 13 foot antenna, a feed horn similar to that described, "dead on" pointing of the antenna and polarization of the feed horn, you can expect a signal at the input to the LNA between -105 dbm and -112 dbm. The uncertainty comes from possible differences in antenna and feed efficiency, and other miscellaneous losses. With a 25 db or more gain LNA such as the Wilmanco, and 50 feet or less of good coaxial cable such as RG213, the input to the downconverter will be about -85 dbm. With a 27 db conversion gain, typical of the MMK1691/70, the signal out will be about -58 dbm, centered on 70 MHZ.

The next block of the system will be a 70 MHZ IF amplifier to filter and bring this level from -58 dbm up to -10 dbm. There must be reserve for level adjustment so the total gain required is about 60 db. The minimum bandwidth of this amplifier is 4 MHZ at +/- 3 db. The maximum bandwidth is not critical but should be less than 10 MHZ since excess bandwidth here will degrade the system S/N ratio which we are trying to preserve or enhance in every cost effective way that we can. There are a number of ways to obtain the IF amplifier. Surplus equipment available at flea

markets will include radar, television distribution, digital radio or TVRO IF strips which can be used with little or no modification. Commercial amplifiers are of course available with appropriate specifications but these can be very expensive. A third way to go is to build the amplifier yourself. At 70 MHZ, parts layout is not exceptionaly sensitive and if you have had a little experience with RF circuits then this approach is practical. Figure 5 gives a suitable design.

This is a high gain RF circuit and must be built with good RF construction practice. This means short leads, a ground plane under the parts, and good decoupling on the 12 volt power supply distribution. The AGC control will be adjusted to provide about -15 dbm output at 70 MHZ to the demodulator. The maximum gain available is about 65 db which should be sufficient for even a low gain downconverter. The bandwidth is about 12 MHZ, which is larger than necessary but the single tuned response produces a smooth low distortion phase slope at the edges.

Assuming that we now have the 70 MHZ signal at about -10 dbm, the next step is a phase demodulator. This circuit is a little tricky. The binary data has been modulated onto the carrier as BPSK, zeros are sent with the carrier phase unchanged while ones are sent with the carrier phase shifted 180 degrees or inverted. In order to build a practical phase detector it is necessary to have a replica of the exact carrier frequency, however the spectrum of the received BPSK signal has no component at the center to define this carrier frequency. An ordinary phase locked loop, for example, cannot be used since there is no carrier for it to lock onto. There are a number of circuits in the literature which have been devised to deal with this problem and all depend on some kind of nonlinear operation on the signal to recover the carrier. For example, squaring will produce a component at twice the carrier frequency which can be divided by two to yield the desired signal. For VISSR use, a good circuit choice is the Costas Loop.

The Costas Loop is a variation on a phase locked loop which compensates for the lack of carrier, or expressed in another way, it compensates for the phase reversals of the carrier. Figure 6 is a block diagram of the Costas Loop. The input signal is split into two channels and mixed (multiplied) by the local voltage controlled oscillator at zero and ninety degrees phase shift. The baseband output of the mixers is filtered by lowpass filters with a cutoff just above the data rate. These filters are the final determination of overall noise bandwidth. The two channels are then multiplied togather and the output fed as correction to the VCO. Demodulated data appears at one of the lowpass filter outputs and frequency error appears at the other. In a crude way the loop operation can be understood by thinking of the data input to the VCO multiplier as reversing the

correction phase at the proper times to be in step with the carrier phase reversals and therefore fooling the VCO into behaving as in an ordinary phase locked loop. At any rate, it does work and the output from this circuit is the VISSR data stream we want, at 2.11 MBPS. Trying to examine this data stream on a scope, by the way, is an exercise in futility unless it is a storage scope. If you trigger on the transitions with a non-storage scope, sucessive lines will overlay and you will not see individual ones and zeros, just their superposition. This is commonly called an "eye" pattern and is very useful anyway in diagnosing signal quality. The degree to which the center part of the eye is clean and free of any out-of-place transitions is a measure of S/N. For sucessful VISSR pictures, the eye must be at least 80% open, hopefully more.

A detailed schematic of the Costas Loop demodulator appears in figures 7A & 7B. The only part of the circuit which requires care in layout and construction is the 70 MHZ voltage controled oscillator and amplifiers. This section should be built above a ground plane with short leads and good power supply decoupling to prevent any parasitic oscillation. The remainder of the circuit is not critical as long as reasonable rf construction practice is followed.

The lock bandwidth of the loop will depend on 70 MHZ input level and should be adjusted to about -15 dbm. The loop is tuned by observing the output on an oscilloscope while adjusting the VCO with the 10K tuning potentiometer. The loop time constant is about 1 second, so the adjustment should be made slowly. As the VCO approaches 70 MHZ, the output will show a beat frequency which will clearly lock at 2.11 MHZ. It may be necessary to tune to the other side of lock and back up as the lock character is not symmetrical around the lock point.

The raw data stream out of the demodulator contains the combined VAS data and clock which have been exclusive or multiplied togather. The quality of the signal can be judged as described above by triggering an oscilloscope on the signal transitions and adjusting sweep speed for about 2 bit times across the screen. It will be normal to see lots of jitter on the edges but the pattern should be free of noise and stray transitions in at least 80% of the middle of each eye.

The next block of the system is the bit synchronizer to separate the clock and data which have been combined into this bit stream. At this point we are recovering a bit stream in which the data and clock have been multiplied togather. This is a very simple, binary, operation done by an exclusive OR cicuit where the data is one input and the clock is the other. It is done to increase the transmission efficiency. Sending the clock on a separate channel would be wasteful since it carries very little

information, only its phase and frequency. Reversing the process to separate data and clock again, however, is not so simple. The problem is that after the multiplication we don't know readily whether a particular transition belongs to the clock or the data. It is only in the longer term (many bit times) that we can be sure that there have been on average, R, clock transitions where R is the clock rate.

This fact, that on average the bit stream carries a constant clock rate, is the clue to clock recovery. In the frequency domain, if we look at the bit stream on a spectrum analyizer, there will be multiple peaks spaced at the clock rate. A straightforward idea for recovery is to feed the bit stream to a phase lock loop and see if it will synchronize to the "hidden" clock. This almost works. The problem is that except for special cases, even though the spectrum peaks are spaced at the clock rate, there are nulls at the actual clock frequency and its multiples. There are a multitude of spectrum lines for the PLL to lock on, but none at exactly the right frequency ! Fortunately the solution is easy for moderate to high signal to noise ratios. If we feed this bit stream to a nonlinear circuit of some kind (almost any kind) we will regenerate spectrum lines at the clock rate and its multiples. By filtering out the fundamental and feeding this to the PLL, we will have recovered the pure clock. The bandwidth of the PLL must be set low enough to suppress phase jitter from the "random" data transitions but this is not a critical parameter.

A suitable circuit for clock recovery appears in figure 1. The first section of this circuit is simply a filter matched closely to the spectrum of the data bit stream in order to remove noise as far as possible without cutting into the information itself. Following this is an edge detector or differentiator which forms short pulses on the edges of the filtered waveform. For a noise free signal this would produce a "spike" at each edge of bit stream. This is the nonlinear operation which regenerates the clock lines in the spectrum. The pulses are then used to synchronize a PLL running at twice the clock rate. The 2 x clock line is strongest in the regenerated spectrum and most reliable for PLL lock. The PLL frequency divided by 2 then yields the 2.11 MHZ clock we need to synchronize further operations.

In order to complete the process of deriving a separate clock and data stream we must account for the NRZ-S coding of data prior to combination with the clock. NRZ-S coding replaces the original data with a transition, either 1 to 0 or 0 to 1 depending on the original state, when the source data is a zero. If the source data is a 1 then the output stays in its original state. For example a continuous data 1 would produce no output transitions while a continuous data 0 would produce a square wave output at the bit rate. In the VAS case it is this NRZ-S coded

data which has been multiplied by the clock. The HC175 and exclusive-OR gate in the circuit of figure 1 strip off this encoding and produce a clean, separated data output. Additional circuitry in figure 1 examines the data stream for coherence between the clock and provides a signal to indicate whether or not there is valid data coming out. If there is, the "BIT SYNC" light comes on. During normal operation this light will blink out during the 50 millisecond period every spin (600 milliseconds) when the VAS transmitter is turned off.

FRAME SYNCHRONIZER

Now we arrive at something of a problem in planning. The current format of VAS data is organized according to a scheme called "Mode AAA". This specifies the exact placement of telemetry data, image data, and synchronizing bits within the overall flow of data and must be used to comb out the images we want. The frame synchronizer is a very specific, dedicated design which uses the format description to arrive, finally, at individual image bytes which can be placed in an image frame buffer to display the pictures. Unfortunately, NOAA is currently in the process of revising this formatting scheme to another version called "GVAR" to be effective with the launch of the next GOES satellite sometime in late 1989 or 1990. As a result my design for the frame synchronizer, while it works fine today and can be duplicated, will only be valid until the next GOES launch. I will be revising the frame synchronizer design to work with GVAR but this won't be completed until late this year or early 1989. Consequently the remainder of this article will be more of an overview of the circuits and process than in previous sections. If any readers do want to duplicate the mode AAA circuitry I will be happy to provide the circuits and more detailed information.

Once the separated clock and data are obtained at the output of the bit synchronizer, the processing becomes entirely digital. However, the high bit rate, 2.11 MBPS, and the requirement to locate specific patterns in the data stream to identify image boundarys precludes feeding the data directly into a personal computer serial data port. Even "turbo" speed PC's would not be able to ingest this data and separate telemetry from image bytes at the required rate. Fortunately the task can be done simply in dedicated hardware and provide organized image data to the PC from memory mapped onto its own data bus.

The basic frame of stretched VAS data is organized as 12 blocks, each lasting 50 milliseconds. This entire frame, which takes 600 milliseconds, is transmitted during one revolution of the satellite spinning at 100 rpm. The beginning of each block is identified by a unique 10,032 bit pattern in the data. The frame synchronizer must identify a fragment (or all) of this pattern

precisely and then use the identification time as a reference point from which to count out bits and words representing the desired images. Several methods exist for identifying this initial block synchronization word. Digital correlation by integrated circuits such as the TRW 1023 is straightforward but expensive. The method used in the present circuit designs compare the ongoing data bit stream with the output of a PN sequence generator which itself produces the synchronizing pattern. If there is a mismatch, the local generator is restarted. Eventually there will be coincidence between the two patterns and when they have run togather to the end of the sequence, a flag is set for other circuits to begin operating. The local generator is allowed to continue running because the data must be multiplied by this sequence to remove a randomizing function imposed at the transmitter.

The organization of data in the 12 blocks of each line is described in the NOAA/NESDIS publication "Operational VAS Mode AAA Format, Specification SFP 002 - Version 2.2". Each block consists of a general information header giving the block number and other details, and an information field containing image documentation and the image data itself. The frame of 12 blocks contains data for 1 line of infrared image in two different spectral bands and data for 8 consecutive lines of visible spectrum image. There are 3822 ten bit image words in the infrared blocks and 15,802 six bit image words in the visible spectrum blocks. The documentation fields of these blocks contain a wealth of information for calibration, gridding, location of the field of view, orbit parameters, and so forth. There is so much information, not to mention so many image words, that the primary design task for a low cost system is deciding what to eliminate. The principle technique for simplifying the reception hardware and lowering its cost is to select a small portion (512 bytes) of the incoming data which is adaquate for the users purposes and saving only that portion in a cache RAM. At the end of the block there is adaquate time to transfer this cache into the associated personal computer. The cache interface hardware is configurable for selection parameters, mainly the number of consequtive image words to skip, so that different geographic coverages can be achieved. By saving only every 30th image word for example, the entire width of the full globe can be displayed in a 512 byte image line. The actual resolution in this image would be quite low, of course, but when smaller geographic areas are desired, fewer image words are omitted and the resolution is approximately matched to the field of view.

The design of the cache RAM and associated timing hardware will be highly specific to the personal computer selected for data handling and display. The present frame synchronizer circuits are intended to work with the common XT class computer. This interface maps the temporary cache storage into the XT

memory space and issues interrupts at the beginning and end of each data block. The beginning interrupt allows identification of the block and a decision on keeping or skipping that block. If it is to be kept, the data is transfered out of the local memory following the subsequent interrupt and directly into the image frame buffer memory for immediate display of the line. This technique avoids any requirement for extended memory on the main computer bus. Timing parameters are set up through several I/O ports on the interface. In addition to image data, the general information telemetry available in the IR blocks 1 and 2 is extracted, displayed and updated on the XT computer screen once per line.

High speed operation of the computer is not a prerequisite, my system operates at the lowest common clock speed, 4.7 MHZ, and adaquate time is available for collecting 512 data bytes per image line and transfering them to the display memory.

FRAME BUFFER

As in the choice of computer, the choice of a frame buffer for video image display is wide. The conventional CGA and EGA display cards are not suitable for the purpose because their resolution and grey scale are too restricted for satisfactory VAS images. Some of the recent VGA displays will provide 640 pixels x 480 lines at 256 colors/grey shades which is adaquate for some uses. A more satisfactory solution, still at moderate cost, is to use an "image processing" type frame buffer card available from several manufacturers for both XT and AT class computers. The minimum configuration of these buffers is 512 pixels x 512 lines at 256 colors/grey shades and a typical example is the AT&T TARGA model M8 in the $2000 price class. This is entirely satisfactory for monochrome VAS image display and allows experimentation with color representation of albedo.

The final consideration in the low cost system assembled around the XT or similar personal computer is longer term storage of the images. The technique described stores the image in the local memory of the frame buffer while it is viewed. If it is to be saved it can be transfered out of the frame buffer onto fixed disk or floppy disk. One 512 x 512 image will require 225K of storage space but this can be reduced by any of the popular "archive" data compression programs to about 150K.

2989. Help with MFJ-1278 needed!

Newsgroup: rec.ham-radio
Date: 1990-11-11 05:35:55 UTC
From: dan@heimat.UUCP
Message-ID: <219@heimat.UUCP>
Source record: 6699
Cross-posted to: rec.ham-radio,rec.radio.shortwave,misc.wanted

-=-

Ive just bought a used MFJ-1278 to use at my monitor station and need a
bit of help with it. It came with version 0 of the manual (a yellow color).
This manual is the worst ive ever seen, it does not list half of the commands
available and it has only details on packet. No mention of RTTY, CW, AMTOR,
FAX, or SSTV. So if anyone has a list of the commands with options, or can
supply info on how to use the amtor, fax, or sstv modes - please share them
with me. Ive gotten it to work with RTTY and CW (though CW seems to be a
bit flakey) but ill also accept any help with these modes. Packet, well ive
done some monitoring but the manual covers al I need to know.

Send all replies via e-mail and ill post a summary if the net wants.

2990. Re: DSP workbench

Newsgroup: rec.ham-radio
Date: 1990-11-11 05:54:09 UTC
From: mcmahan@netcom.UUCP
Message-ID: <16611@netcom.UUCP>
Source record: 6700

In a previous article, phil@east.Berkeley.EDU (Phil Lapsley) writes:
>Perry asked what to me seems like a crucial question for getting people
>to experiment with DSP: Are DSPs as easy to program as Apple II Basic?
>The answer to that question today is a strong "no": today's DSPs
>typically require programming in rather esoteric assembly languages,
>and require the programmer to have a good theoretical knowledge of
>signal processing.

For dedicated DSP applications this is definately true, since the data rate
is so high that only fast hardware will do the job. You would be amazed at
what can be done on a 68000 these days, though. A bit of creativity and some
theory can yield filters, FM demodulators, peak detectors, and other things.
You still have to be able to write code that uses tricks and runs fast, though.
The theoretical knowledge is also required so you can know the limits of what
you want to do. To me, DSP isn't a synonym for "doing lots of math real fast".
It means being able to use a CPU to process a continuous stream of numbers to
yield a desired result. Of course, being able to bang bits at lightspeed is
usually required for all the fun stuff, though.

>Unfortunately, Gabriel is written in Lisp, and requires something like
>a Sparc-1 with 16 MB of memory to use. But as hardware prices fall and
>performance increases, it may not be that long before homebrewers are
>able to afford that sort of setup.

Personally, I like to use MatLab for DSP simulations. It runs on a PC clone
(but requires a math co-processor) and contains built in functions to do
things like FFT's, digital filtering, etc. You can also write your own
functions. Note that this is just a proving ground for your ideas, though.
MatLab isn't designed to do things in real time. It's just an easy platform
to program up an idea and check out the validity. You will still have to
have a good CPU and compiler to implement the concept and handle signals that
are live.

WANTED WANTED WANTED

I'm looking for a 24 VDC power supply with about 7 to 10 amps.
This will be used by the students at Newberg High School for the
study of motors and robotics. Regulation is not critical.

If you have access to something like this, a donation or loan
would be appreciated. The school has no money for the purchase
of a supply. If you can help, it will make you feel real good
that you're helping these young people learn about science.

Contact: Terry Coss
(503) 537-3171
or
Neil Robin
(503) 629-1516 (w)
neilr@tekgen.bv.TEK.COM.....

Thank You very much for your help.....

That wasn't the intended thrust of my question. I intended to convey this:
"How do people get their licenses without learning enough to answer at least
some of their own questions?"

My own perception is that, for example, anyone with an Extra Class license
really ought to be able to read a circuit diagram well enough to tell which
pin goes where on a mike jack and similarly elementary questions. A Novice?
Maybe not. An Extra? Certainly!

Probably just what it sounds like. Transmit the picture created by a camera pointing at a radar PPI scope. We did it around here years ago.

Most phone DXing and contesting is conducted in English (well, most is in Amurrican but we'll overlook that). Suppose you were Japanese, didn't speak English, but got interested in amateur radio and DXing. Do you really think that learning cw in order to do cw DXing would be such a terrible thing when compared with having to learn English in order to do phone DXing?

How many of the licensed Russians (for example) know English well enough to converse over the air, pick out weak calls with non-standard phonetics etc? If you want to work lots of Russians from here, it's a good idea to be able to use cw. Sure, you can work all the oblasts on phone, but the last time I heard of someone doing that it was reported as a "gee whiz" achievement in a DX mag, while nobody ever gets a mention for working them all on cw.

What's my point? Just that the dislike of cw among some of the people on this net is probably conditioned by the fact that speaking English is not a problem for them. If international communications were all either in CW or in Japanese, you would be facing the same sort of choice that many Japanese face in getting on the air. It also means that if you want to work lots of JAs and UAs it is a good idea to stay fluent in cw.

I don't see a lot of difference between the attitudes "they should all learn my language" and "I shouldn't have to learn cw", or, for that matter, "why can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you probably can).

I understand that this is not addressing the current requirement to learn cw in order to make "I'm on my way home, honey" calls on 2 meters, but the no-code thing goes further than that, I think. Most anti-code people would like to see the cw requirement dropped for HF operation, and the next logical step would be opening the cw bands for phone operation. Meanwhile, a good fraction of all the "foreign" stations will still be using cw because it is easier than learning English for many of them.

I also realize that I am equating "HF operation" with "DXing" but I think of them as the same thing. I don't go on 20m in order to talk with people in the same country, although some people obviously do - they need professional help :-)

How about identifying "Mr HIGH UP"? These are serious
allegations. If such a plot exists, it could be short-circuited by a
little "premature" public and media awareness of government
shenanigans. If it cannot be proven, these scare rumors are not
welcome. They do more harm to the hobby than good.

I just picked up an interesting little device at a close-out store in NY. It's called SOUND SENDER, and it's one of those devices designed to interface an outboard tape player or CD player to your car's FM radio. Here's the twist: it does not connect to the car radio - it transmits to it.

Opening up the device (which looks like an oversized cigarette lighter plug with a fine tuning knob, and audio cable coming out) I find a single PC board containing some passive parts, a tuneable coil, and a large "antenna" in the foil pattern. It seems to transmit the audio input (in mono) via brute force.

At home it could easily transmit to a stereo receiver across the room. There is no FCC information on the package or device, and no statement of the output power. Is this legal? Or is that why it's being closed out :-)

RADIO-M1/RUDAK-2
================

The joint work of AMSAT-U and AMSAT-DL for creating the
set of equipment for the satellite RADIO-M1/RUDAK-2 is
completed.

The idea of the cooperation between two groops in the
USSR and Germany appeared in the spring 1989. The discussion
about what and how it is necessary to do lasted till the meeting
of the representatives of two groops in Surrey in July 1989 when
the mutual preliminary agreement about the cooperation was
signed.

The final version of the agreement about the cooperation
was signed in the autumn 1989, when the work over the project
was being done.
According to the mutual agreement the group ORBITA AMSAT-U
develops and makes the linear transponder, command radio link,
telemetry system, power supply system and decides all the
questions with the official organisations about the placing of
the equipment and launching.
The RUDAK group of AMSAT-DL developes and makes the digital
part so called RUDAK-2. This part includes a digipeater and a
mailbox (protocol AX-25).It also provides other possibilitys
for the experiments on the transmitting of the information
using modern digital methods. It also contains input and
output RF circuits.
The complete set for ground command station is developed
by Amsat-U-Orbita and Amsat-U-Sputnik groups.Rudak group
brings special digital part for it.
During the launch and orbital test period ground command
station will be situated in Molodechno at UC1CWA and in
Moscow at RK3KP. The ground command station for Rudak-2
only will be situated near Munchen-DK1YQ and near
Hannover-DB2OS.

The final agreement was signed:
from the side of AMSAT-U-ORBITA the technical director of
```

the project "RADIO-M1" - V.Chepyzhenko - RC2CA;
from the side of AMSAT-DL - the president of it K.Meinzer -
DJ4ZC.
The coordinators of the project are P.Guelzow - DB2OS and
L.Labutin - UA3CR

SPECIFICATIONS OF THE RADIO-M1/RUDAK-2

Mission

Piggy-back onboard the USSR geological research
satellite.

Launch and Orbit

---

1. Launch (scheduled)
Time: Late of 1990, day is not fixed.
Launch site: North Cosmodrom Plesetsk

2. Orbit (planned)
slightly elliptical polar orbit
appogee: 1000 km
Inclination: 83 degrees
Period: 105 minutes

Satellite specifications

---

1. Dimension and shape
Cylinder of hight about 4 meters
diameter 1.8 meters

2. System configuration
Professional geological research equipment, telemetry
system, command link equipment, transponders and power
supply, thermal control.
Amateur linear and digital transponders, telemetry
system, command link equipment, power supply.

3. Attitude control
Satellite attitude will be maintained by the earth's
gravity field by a rod 9 meters length pointing away
from the earth.

4. Planned service life: 3 years

Radio-M1/Rudak-2 System specifications

---

1. System configuration
Two sets of the equipment will be installed aboard the satellite:

Linear transponder #1 mode B and RUDAK-2 with subsystems
Linear transponder #2 mode B with subsystems
The first set is concidered to be the main. The second one is
reserve. It can be taken into operation in the case of
failure of the first one.

2. Commands

Equiped with real-time program command function

3. Beacons and telemetry #1 set
CW telemetry 8 channels 145.822 MHz 0.2 Watts
Digital telemetry 30 channels 145.952 MHz 0.4 Watts
1100 bps,BPSK/FM, deviation 2kHz
Digital telemetry Rudak-2 145.983 MHz 3.0 Watts
BPSK 1200 bps AX.25 (like FO-20)

4. Beacons and telemetry #2 set
CW telemetry 8 channels 145.948 MHz 0.2 Watts
Digital telemetry 30 channels 145.838 MHz 0.4 Watts
1100 bps,BPSK/FM, deviation 2kHz
Digital telemetry 30 channels 145.800 MHz 2.0 Watts
1100 bps BPSK/FM, deviation 2kHz

5. Transponders #1 set

(1) Linear transponder: inversely heterodined translator
Uplink passband 435.102 to 435.022 MHz
Downlink passband 145.852 to 145.932 MHz
Transmitter output max 10 Watts
Bandwith (3db) 80 kHz
Uplink EIRP required about 100 Watts

(2) Digital transponder Rudak-2: digipeater and store&forward
packet communication (AX.25), telecommunications experiment
with digital signal processing up to nearly 20 kHz,
1 MByte RAM disc, four separate uplink channels.

Uplink frequencies: RX-1 435.016 MHz 1200bps,FSK,NRZIC/Biphase-M
RX-2 435.155 MHz (AFC) 2400 bps,BPSK, Biphase-S
RX-3a 435.193 MHz (AFC) 4800 bps,RSM
RX-3b 435.193 MHz (AFC) 9600 bps,RSM
RX-4 435.041 MHz (digital AFC) RX for RTX-DSP

Downlink frequency: 145.983 MHz 3 Watts

The downlink can be switched to the following operating modes:
Mode 1: 1200 bps, BPSK, NRZI,(NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (Oscar-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) +Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)

Mode 7: FSK (F1 or F2B),e.g. RTTY, SSTV, FAX, etc.(for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (speech)

6. Transponder #2 set

Linear transponder: inversely geterodined translator
Uplink passband 435.123 to 435.043 MHz
Downlink frequencys 145.866 to 145.946 MHz
Transmitter output max 10 Watt max.
Bandwith (3db) 80 kHz
Uplink EIRP required about 100 Watts

7. Antennas

(1) 435 MHz receiving antenna (shared by analog and digital modes):
Helix +3 db max RHCP.

(2) 145 MHz transmitting antenna:
Half wave dipol

8. Power supply

From main power supply system up to 100 Watts
Set #1 consumption 47 Watts
Set #2 consumption 40 Watts

9. Weight

Set #1 approx. 28 kg
Set #2 approx. 22 kg

10. Size: 480x400x300 mm^3 each set.

PACSAT BBS TESTING CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 314.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

PACSAT BBS S/W Beta Testing Continues; Expected User S/W Release Nov. 17, 1990

On Sunday evening, Nov. 4, 1990, NK6K commenced the Bulletin Board System (BBS) operations on AO-16. AO-16 now becomes the second satellite to be running G0/K8KA's spacecraft application software, along with UO-14. The first file uploaded to AO-16 was a file which acknowledged all the individuals who have contributed to the MICROSAT program. Next, it was only fitting that NK6K send a congratulatory message to his colleagues at the University of Surrey (UoSat) via AO-16. Later, the AMSAT News Service (ANS) bulletins and Keplerian elements were uploaded and were earmarked to be "broadcast" continuously from AO-16.

For the next few days, G0/K8KA, NK6K and a group of carefully selected "beta" testers will continue to send messages back-and-forth in an attempt to "wring-out" any last minute software bugs which might have been missed. If no major problems are encountered, G0/K8KA's groundstation software and documentation will be release on Nov. 17, 1990. It will be available for downloading from the AMSAT/DRIG BBS at (214) 394-7438 and CompuServe's HAMNET. This software will allow users to upload and download files and allow users to receive files are continuously broadcast, for example, ANS bulletins or Keplerian elements.

The DRIG BBS will have a brand new section in the FILES menu, called MICROSATS ..... Go into FILES section, enter P for Personal download, and download all of the MICROSAT telemetry programs from this special area. This is OPEN to ALL AMSAT members.... Please do a L;MICROSATS to get a listing of all of the programs available to you.**

Although this first version of the groundstation software is not the "all-singing-all-dancing" software that NK6K and G0/K8KA would like for it to be, it will be more than adequate to allow those with an IBM compatible computer to start utilizing the BBS on AO-16, UO-14, and LO-19 as quickly as possible. At a later time, versions for the MacIntosh computers and upgraded IBM PC versions will be available from the AMSAT Software exchange. Look for further announcements next week in the ANS bulletins about the release and availability of the PACSAT groundstation software.
/EX

SB ALL @ AMSAT $ANS-314.02
AO-16 HAS A NEW SOUND

HR AMSAT NEWS SERVICE BULLETIN 314.02 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

New BBS Software Gives A New Sound To A Young OSCAR

Since the commencement of BBS operations on AO-16 this week, users will find AO-16 sounds quite different from what they remember from the previous weeks. The biggest change AO-16 users will notice is that the 70 cm downlink transmitter is now sending data continuously. But even without the groundstation software, which is planned for a Nov. 17, 1990 release, it is still possible for you to see what is being sent on the downlink. The first thing you need to do is turn TRACE ON on your TNC-2. After doing this you will get a "hex" dump of the raw data frames being received by your TNC-2. Although this technique for receiving packet frames from AO-16 is not the normal way to receive packets, it will allow you to get a peek a what files are being broadcast and other file activity. For those who still wish to digipeat or who want to examine the telemetry, the BBS software will not change these functions, however, telemetry will be sent every 30 seconds as compared to every 10 seconds and digipeating will take more time because of all the other data on the downlink.

The one thing that users who start using the groundstation software will immediately notice is that using AO-16's BBS will be quite different from FO-20's BBS. If you try to connect to AO-16 without the proper groundstation software, after awhile you will be logged off. But when the proper software is used, it will allow users to compose messages off line and upload them very efficiently. If you fail to get the entire message uploaded during a single pass, the ground station software will remember where you were and it is from that point you can continue to upload on the next pass. The same holds for downloading a file; if it doesn't get completely downloaded during a pass, the groundstation software will remember where you were and will pick the file at that particular point on the next pass. The software protocol to perform these very "smart" file transfer operations will greatly facilitate packet traffic handling. It is AMSAT's hope that the PACSATs, ie., AO-16, LO-19, UO-14, will provide another powerful means for communication between radio amateurs worldwide.

[If you have questions on the protocols, you may reach NK6K on CompuServe at 71635,1174 or at nk6k@tomcat.gsfc.nasa.gov. G0/K8KA can be reached at k8ka@tomcat.gsfc.nasa.gov.]

SB ALL @ AMSAT $ANS-314.03
BALLOON LAUNCH ANNOUNCEMENTS

HR AMSAT NEWS SERVICE BULLETIN 314.03 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Denver ATV Balloon Launch on Nov. 18, 1990 & Illinois Launch Dec. 1, 1990

A local Denver, CO AMSAT group and ATV enthusiasts are busily preparing for their upcoming balloon launch. The launch will be on Sunday, November 18, 1990 at 9:30 A.M. MST with a weather hold backup day of December 2nd again at 9:30 A.M. MST. The balloon should reach an altitude of 100,000 feet and will carry a color ATV camera and transmitter, a 2 meter CW modulated FM beacon and a telemetry package. The telemetry package will encode barometric pressure and inside/outside temperatures on an AFSK signal modulating the TV sound sub-carrier. The ATV frequency will be 426.25 MHz and 2 meter beacon frequency will be 147.555 MHz. Forty meter and two meter nets will be conducted on 7.232 MHz and 146.34/.94 MHz, respectively. AMSAT member Jack Crabtree (AA0P) has put together the enthusiastic team of AMSAT members along with a Denver ATV group called Western Vision Network (WVN). The balloon will use the callsign of the Director of WVN, Tim Armagost (WB0TUB). All AMSAT members and radio amateurs within 500 miles of Denver, CO are encouraged to participate in this "edge of space" experiment.

On Dec. 1, 1990 at 9:30 A.M. CST (weather permitting) a helium balloon with a 1 watt 10 meter beacon transmitter named "Drifter-1" will be launched near Champaign, IL. The beacon, located on 28.866 MHz will be sending the following text at 20 WPM: "DE N9JL/B THIS IS DRIFTER-1, A 1 WATT BALLOON CARRIED BEACON. QSL VIA KA9WWA AR." The period of transmission will be determined by package temperature. A launch and tracking net will be held on 7155 KHz beginning at 8:30 A.M. CST with WE9E serving as NCS. This balloon has the potential to be heard direct up to 350 miles and throughout North America during a band opening. Send your QSL and a s.a.s.e. to receive a QSL for Drifter-1 to:

Drifter-1
c/o Jim Lutz (KA9WWA)
2032 Adams. St.
Rolling Meadows, IL 60008

Queries regarding Drifter-1 can be send to KA9SZX @ W9YH.IL.USA.NA. Listen for updates on the weekly 75 meter ATV net on 3871 KHz beginning at 8:00 P.M. EST on Tuesday evenings.

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 314.04 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Fall Edition of ZRO Test Announced

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule through the end of 1990 via AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance tested by copying signals decreasing in strength in predefined steps. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and

repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine"). A participating listener monitors the downlink signals till they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9). This then results in the need for less uplink power for routine communications operation.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday November 24, 1990 at 1700 UTC "B"
Saturday December 1, 1990 at 2030 UTC "B"
Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

DXCC ON OSCAR 0

HR AMSAT NEWS SERVICE BULLETIN 314.05 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

First DXCC on the Earth's Original Satellite

On October 27, Dave Blaschke, W5UN, worked VS6BI to complete the world's first two-meter DXCC. Although his DXCC is not the first "Satellite" DXCC, what makes Dave's accomplishment so unique, is that each of his contacts on two-meters was done by bouncing his signal off the moon (a.k.a. OSCAR 0). An article describing Dave's station can be found in January 1989 QST (p. 15).

Dave's station (1.5KW TX power and 32.5 dBi antenna gain) was uniquely equipped to help AMSAT recover DO-17, which suffered from a receiver de-sensing problem last spring. AMSAT Congratulates Dave on this monumental accomplishment.

[ANS thanks Ray Soifer, W2RS, for the information for this bulletin.]

PORTABLE 9.6K PACKET STATION

HR AMSAT NEWS SERVICE BULLETIN 314.06 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

Effective, Low-Cost, Portable Packet Satellite Station Operational

Researchers at the University of Surrey took their portable packet satellite station out into the field and put it on the air last week. UoSAT/Microsat Software Developer, Jeff Ward G0/K8KA, used the 9.6KB semi-automated packet station to operate UO-14 from his flat (apartment).

As Jeff describes it, other than the antennas, the station fits in a metal carrying case about the size of a small briefcase. The RF gear (built by G0/VE3LMX in the UoSAT Lab) uses single-channel FM receiver and transmitter strips from Wood & Douglas with minor modifications. The transmitter generates 10W output, and no Doppler compensation is used. The receiver has a daughter board with an automatic frequency control circuit. This AFC sweeps the entire Doppler band until it detects the satellite, allowing for unattended operation.

The transmit/receive equipment costs less than $200. The system also uses a TINY 9600 modem (from Pac Com) which is added to the TNC as a daughter board. The TNC and modem both fit into the standard small extruded TNC case.

The receive antenna used was a 1.5 turn helix sitting on the ground pointed more or less straight up, with a turnstile for the uplink. Jeff's initial attempts with a 1/4 wave groundplane on receive gave little success. So as not to alarm his landlords, he put the antennas very close to the house. They are completely blocked on the south and west, but look fairly clear to the north and west.

On the evening of November 3, during a 60 degree pass east of his location, he managed to a connect to the spacecraft FTL0 BBS server, obtained a directory, uploaded a message and download about 16 kbytes. He then switched to the broadcast protocol, requested and received an AMSAT Keplerian element file. The next morning he was able to download a reply to his message. Jeff feels that he should be able to receive one hundred Kbytes of data on any pass of 10 degrees maximum elevation or better.

This effort shows that, as many people have shown in the past, you don't need lots of money to get into this corner of the hobby.

R.I. DXPEDITION A SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 314.07 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

DXpedition Proves to be Interesting on Both Sides of the QSO

AMSAT Volunteer Frank MacKensie-Lamb, NG1I, had been planning a DXpedition to the state of Rhode Island, but was undecided as to where to set it up. The week prior to his planned operation, Frank was contacted by a Ham in Rhode Island who had been interested in seeing an operational satellite station. Rather than have this potential newcomer drive up to Frank's QTH in Massachusetts, Frank decided to take the station down to the interested ham's QTH.

On Saturday, Nov 3rd, Frank drove to Lincoln R.I. and from the side yard of his host's QTH, NG1I/1 operated Mode B on AO-13 for approximately 5 hours. Because of advanced advertisement of his DXpedition in ANS as well as on the bird itself, a number of stations had already made plans to look for Frank that day and a mini-pileup ensued. By the end of his operation, Frank had logged 62 QSOs in 11 countries on 4 continents.

The interested host was extremely impressed by how little it took to get on the air on AO-13. Frank at times had to increase his output power to about 70 watts, due to poor squint angles, but as squint angles improved, he was able to throttle back to 45 watts and still carry on armchair copy QSOs, again proving that you don't need much power to carry on QSOs.

For those stations who did manage to help Frank demo his satellite station, his custom made QSL cards (made special for this DXpedition) can be obtained by mailing your cards to:

NG1I/1 Frank MacKensie-Lamb
P.O. Box 2058
Natick, MA 01760

One European station mentioned to Frank that he needed Wyoming, and he wondered if next weekend NG1I could do a DXpedition out to "0-land" Although Frank had to decline that particular request, it seems that the portable operation bug has bitten Frank, and so you may find additional satellite DXpeditions bearing the call NG1I (most likely they will be in the New England area).

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 314.08 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

17 Nov 90 145 B 1300 KA5SMA WB9ANQ Saturday
24 Nov 90 97 J/L 1430 WD0E N5BF Saturday

02 Dec 90 63 B 1530 WB6LLO WA5ZIB Sunday
08 Dec 90 156 B 1300 WB9ANQ KA5SMA Saturday
15 Dec 90 97 J/L 1400 N5BF WD0E Saturday

STS-37 astronaut Jay Apt (N5QWL) will be the featured guest on the 24 November 90 net. Jay will be discussing late plans for his own flight, which is to be flown next spring, and STS-35, which is scheduled for early December. This roundtable/interview session with N5QWL promises to be very interesting.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 314.09 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 10, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The Command Stations have oriented the spacecraft to an attitude of:

BLON = 180 and BLAT = 0

AMSAT-OSCAR-10 has come out of hibernation and appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately.

3002. Dual band antennas for an HT

Newsgroup: rec.ham-radio
Date: 1990-11-12 00:23:36 UTC
From: RTDIMO%GOR1@LEAV-EMH.ARMY.MIL
Message-ID: <9011121913.AA29546@ucsd.edu>
Source record: 6712

Gordon Charrick wrote about sorry antenna supplied with IC-24AT. He is absolutely correct, it is sorry, but works great in areas where you have a strong repeater signal and intermod from pager services. It keeps out unwanted signals. But for weak signal work and out of band stuff you need a good antenna. I bought Japanese name brand: Maldol HS-702S from H.C. VanValzah Co. It is probably somewhat like the Diamond antennas others on the net have said they bought. When I put this antenna on the Ic-24AT I own, signals jumped up to full scale when before I couldn"t even hear them with the supplied dual band duck. It works great on all freq (including 870 MHZ and up). This antenna is flexible and 17" long. I Think I paid about $22 for it. I looked at the MFJ (too rigid) and the Larsen (too expensive) but after careful testing with three or four antennas, I decided the best all around was the one I bought. It is probably about the same as the Diamond (the diamond is $2 more). Whatever you do, I would not recommend buying an extended antenna that is not flexible. The first time you hit something with it you'll be resoldering your antenna connector inside the radio (no fun at all).

3003. Help with MFJ-1278 needed

Newsgroup: rec.ham-radio
Date: 1990-11-12 00:34:57 UTC

Source record: 6713

Dan "Sneakers" Schein writes
> I've just bought a MFJ-1278 -- and need a bit of help with it...
Dan, I tried to send direct to you but msg came back undelivered. I'll
post here for you. I recommend you find someone with a manual and copy
it. There are just too many commands to post on this net or to send a
msg about. But here are some basic commands (if you are running MFJ-1284
Terminal Program, version 3.0)
Mode VP (packet)
Mode HP (hf)
Mode VB (VHF RTTY)
Mode HB (HF RTTY)
Mode VA, HA (ASCII RTTY)
Mode FX, FAX(CTRL F7 starts it)
Mode TV, SSTV(ALT F7 starts it)
To quit any mode back to CMD: hit F1.
Receive: K, Transmit: CTRL T (back to receive: CTRL R)
Hope this helps. Try to get a book, you really need it.

> compared with having to learn English in order to do phone DXing?

Now when I lived in Denmark with my no-code licence I used to
chat to Germans on 2M SSB. Many of them didn't speak English. Many of
them, like me, didn't know Morris. So I learn't how to do the "You're
Fahvenine Copenhagen -QSL?" routine in German. I got so good at it
that sometimes the German station would come back to me and drone on
for hours about the shack, the wife, the kids and the garden with me
understanding about 2% of it.

Despite the problem of sounding too fluent I managed to fill the log
book with Germans. I even crammed a few French stations in as well.
When you get down to it. Knowing Morris QSO speak for the average
contact is no different than knowing German, French, Swedish, Spanish
QSO speak for the average contact. The only thing that ever threw me
was the Swedish OFs that said something that sounded like "Al
Verdanner Op" for CQ. But after hearing it a few times I caught on.

In most languages the CQ amd Q signal stuff is common. Some countries
say "Come" some say "Go" for an over. But a couple of nights
listening and it should become plain.
> How many of the licensed Russians (for example) know English well enough to
> converse over the air, pick out weak calls with non-standard phonetics etc?

Most Ruskies (certainly pre Glasnost) would only give name, sig
report and QTH, with QSL via box 88. So even if you did speak Russian
as some of my friends did, the chance of a "How's the wife?" QSO was
pretty slim.

>
> I don't see a lot of difference between the attitudes "they should all learn
> my language" and "I shouldn't have to learn cw", or, for that matter, "why
> can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you
> probably can).

I certainly believe that you should learn enough of any language,
even Texan, to be able to chat to the natives. If CW is the language
of the HF bands, then a working knowledge will be helpful. And yes, if
you want to work some of the more obscure parts, CW is a distinct
advantage. Chances are, if you really want to know what the fries are
like in the Ouagadougiou Wendy's you will have to ask the Burkina

Faso station in CW. If English is not his language though, he may not
understand the question and reply that it is "Not raining in Tokyo".
>
>
> I also realize that I am equating "HF operation" with "DXing" but I think of
> them as the same thing. I don't go on 20m in order to talk with people in
> the same country, although some people obviously do - they need professional
> help :-)

Now when I lived in Denmark, a whole bunch of local Danes used to
sit on 14.20 and chat amongst themselves in Danish. I believe they
have since moved. Every now and again an Ex-pat would call in and
they would chat in Danish and log one more country. The appearance of
a Danish speaking DX station was always written up - with QSL info -
in the Danish Ham rag. But despite that, yes, HF is for DX and the
local FM repeater is for local chats, unless you also use it as a
phone patch to call foreign countries to set up HF skeds :-)

>band, etc.
>
>It's silly to require people to learn the Morse code in order to just
>be allowed to talk.

Rahul: these ideas have already been suggested, and in fact are considered
by many to be reasonable and appropriate.

The elaborate idea of testing peole for each type if thing they get into,
which in the opinion of some as simply be unnecessary, just won't fly with
the FCC at all due to bureaucratic limitations (e.g. $$$).

While we still need to require code for access to HF, we don't want to do
this is such a way as to require a lot of classes.

Here's what to do. Design a system of license classes. Make it meet these
requirements:

1. CW required only for access to HF.
2. Specify which new class each currently licensed ham will be grandfathered
into under your system. No one is to lose any privileges they now have.
3. Make sure there is an upgrade path from any class to any other class that
has additional privileges.
4. All non-HF privileges must be earnable w/o being bundled with HF so that
it isn't necessary to learn code to earn unrelated privleges.
5. The number of classes must be the absolute minimum necessary and under
no circumstances more than 6. Fewer is always better.

Also consider:

6. ...no overgranting of new privileges by the grandfathering process unless
there is some describable reason for it.
7. ...some degree of status quo on the HF structure for the purpose of
not mixing up the issue of codeless access to VHF-up and the issue of
abolishing incentive licensing.... if you can.

>Here's my modest proposal: provide (small) code-free [vsu]hf subbands.
>If they turn into glorified CB bands, then don't give them any more
>bandwidth. If they turn into real technology mills, then expand them.

My argument against this is that small subbands won't produce any usable
results due to:

1. Subbands might be too small.
2. Semi-ghetto effect due to lack of contact with hams on the "main"
subbands.
3. Duplication within these subbands of band planning done elsewhere
and resultant planning/ccordination problems.

Would you set aside part of the repeater subband? The packet subband?
The DX subband? The experimental subband? The ATV subband? All of these?

NIMBY!!

>I work in a similar environment. One person here has been a factor in
>five people getting licensed. That's ~10% of the organization.

Maybe we need more people like that one person.

>>Sometimes people begin to get interested. Then they inevitably ask the
>>question, "Do you still need to know the morse code?" Given that the
>>answer here is still "yes", they immediately lose all interest.

>perceptions, you don't have to agree with them. Two guys here knew they
>were being hazed, but then got into the challenge so much, they went for
>13 WPM !

And what if they had NOT been hazed? Might they be going for 20 or even 35?

The CORRECT answer is "Morse Code is required of ALL amateurs for privileges
on HF frequencies by international treaty. Because the hams who are
interested in HF (and thus have frequent use and need for Morse) know
that learning code is easy, and to a great extent because they spent
a great deal of time learning it (even though it is "easy") they want
all US amateurs to do so, even if the prospective ham has no interest in
HF at all (heresy!)".

>For anyone who plays Tetris, or any of those video games, Morse Code is
>like making it to Level 5, 13, or 20. I've watched my wife spend hours

Also, it would seriously foreshorten the (already threatened) life of the
Amateur Service.

I learned just barely enough code to pass the Novice and didn't need any
more to pass the Tech. I presently have no interest in Morse Code.

I take it that what you mean is that each *HF* amateur that does not now
know Morse Code at least knew it at one time and so could pick it up again.
But of course this does not apply to VHF and above.

For a country the size of Kuwait, I'd agree. For a country the size of
USSR or USA, HF is needed just to get to the other end. There are other
legitimate amateur uses of HF besides DX and contests.

3009. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-11-12 06:44:06 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901111234406.20400438@HG.ULeth.CA>
Source record: 6719

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 10 to November 20, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 04 NOVEMBER TO 10 NOVEMBER.

Solar activity has been low to moderate over the past week. Several
M-class flares have erupted since 04 November. The first M-class flare
activity occurred on 04 November with the eruption of a class M2.1/1B Tenflare
with associated bursts of rich radio emissions. The emissions at 245 MHz
peaked at 11,000 s.f.u., while 10 cm emissions remained confined to 330 s.f.u.
The flare occurred at 17:41 UT from Region 6347 (S21E15 on 04 November). This
flare had no terrestrial impacts. Activity has since fluctuated at low to
moderate levels since 04 November. The most recent moderate activity occurred
on 11 November when a class M2.1/SF flare occurred from Region 6361 (flare
location: N10E18) at 04:36 UT. The duration of this flare was 56 minutes
and did not produce any short wave fades.

Geomagnetic activity was unexpectedly quiet throughout much of the past
week. Effects from a coronal hole never materialized as was expected early in
the week. Perhaps the most noteworthy period of geomagnetic activity was the
inactivity of 05 and 06 November. A-indices were way down on these days. The
A-index values at Boulder Colorado, for example, dropped to a value of 1 for
24 hours during this period. Recently, however, the geomagnetic field has
become more active with periods of active to minor storming being observed at
higher latitudes (as of 11 November).

Auroral activity has been practically non-existent this week over low and
middle latitudes. High latitudes were also void of any auroral activity
throughout most of the week. On 10 November, auroral activity became visible
at high latitude and northerly middle latitude locations, but remained mostly
of low intensity over middle and many high latitude locations.

Radio propagation conditions have been normal to above normal over the
past week, with fair to good propagation over high latitudes earlier this week
and good to very good propagation over middle and low latitudes throughout most
of the week. Propagation became somewhat degraded over middle latitudes on the
evening of 10 November, but has since improved to normal or better conditions
(as of 11 November).

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain low to moderate throughout the next week. Region 6361 (N08E04) which has a Beta-Gamma magnetic configuration, is very capable of producing several more M-class flares. This region has been the site for most of the flare activity. It has produced numerous subflares. Most of the activity has been observed to occur just north of the leader spots. This regions' beta-gamma configuration increases the chance of witnessing a major flare. Current flare probabilities for the next 72 hours follow:

Flare Type	24hr	48hr	72hr
Class M:	50%	50%	50%
Class X:	05%	05%	05%
Proton Flare:	05%	05%	05%

The potential for a significant proton flare is small and has not changed the PCA alert condition. No PCA's are expected from the regions currently visible on the solar disk. The 10.7 cm solar radio flux should begin a gradual decline over the next week, barring any significant growth in Regions 6358, 6361 and 6364. The preliminary solar flux peak for this week occurred on 07 November with a peak flux of 215, which was within the predicted range for this solar rotation. The current sunspot number for 11 November is 274, and is also expected to begin a gradual decline over the next week.

Geomagnetic activity is expected to remain mostly quiet to unsettled over the next 72 hours at least. Activity may become slightly enhanced on 15 or 16 November, but is not expected to reach storm levels. Conditions should remain predominantly quiet to unsettled at low and middle latitudes. High latitudes should remain mostly unsettled throughout the coming week.

Auroral activity will not be visible from low and most middle latitude stations this week. High latitudes may witness periods of low auroral activity, but such activity will not be too common even at high latitudes.

Radio propagation conditions should remain similar to what they have been like over the past week, with normal to above normal propagation over most paths. There is a moderate risk of short wave fades (SWF) and sudden ionospheric disturbances (SIDs) over the coming week on the sunlit hemisphere of the earth. Potential flare activity may produce SWFs and SIDs, particularly if Region 6361 continues to exhibit a beta-gamma configuration.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 11 NOVEMBER

|-------------------|--------|--------|--------|-----|------------|
| Geomagnetic Field | Thu. | Fri. | Sat. | Sun.| Anomaly |
| Conditions | Given in 3-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder,

Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (11 NOVEMBER - 20 NOVEMBER)

```
_____________________________________________________________________
| EXTREMELY SEVERE | | | | | | | | | | VERY HIGH! |
| VERY SEVERE STORM | | | | | | | | | | HIGH |

| Geomagnetic Field |Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun|Mon|Tue| Anomaly |
| Conditions | Given in 8-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and

unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

3010. Where can I get a Kenwood owner/tech/users manual?

Newsgroup: rec.ham-radio
Date: 1990-11-12 06:47:51 UTC
From: mcmahan@netcom.UUCP
Message-ID: <16665@netcom.UUCP>
Source record: 6720

As it says in the header, I need to find any and all printed info on the Kenwood R-300 receiver. This radio is a shortwave receiver. I am going to purchase a used one for $75 from a friend of mine, but it comes with no paper. I'm looking for an address or phone number of a place to order every shred of printed matter on this thing, all the way from user's manual to schematic and theory of operation (if such a thing exists). Also, if you know of any user modifications that can be done to this model, please let me know about them.

** End of Quote **
Not entirely true! The RULES still prohibit control of a repeater using the freqs below 220.5Mhz! ONLY 220 and 440 rptrs may be controlled on their inputs! A 2m machine or lower may not be because an auxillary station may not control another station (the rptr) below 220.5....and that hasnt changed.

** End of Quote **
The downtilt problem is for those who are on a 1000ft or higher tower/mount, etc and live in the shadow of such...for systems on 500ft or similar towers, no downtilt is necessary....here in Houston several rptrs are using the Diamonds...yes they do make a MONO band UHF antenna (get their lastest catalog!) I would also suggest NCG and the Comet line they carry! Excellent antennas! I am using their short dualbander (2X4FZ) and it is a good performer for the price! (about 120)

I accidentally discovered a swapnet on 3898KHz Friday evening at 0130 UTC. I was wondering if anyone out there knows what the actual hours of operation are for this swapnet and if anyone knows of other frequencies and times of operation for swapnets? I found it very interesting and helpful even though I am not a ham--it seems everyone gave their phone numbers out so that persons without a transmitter could still participate.....

3015. Re: No code license & CW Bashing

Newsgroup: rec.ham-radio
Date: 1990-11-12 14:19:56 UTC
From: bill@platypus.uofs.edu
Message-ID: <151@platypus.uofs.edu>
Source record: 6725

I realize that there is no likely hood of this ever getting as far as
the FCC for consideration, but what is wrong with a KISS license plan??

Example:

CLASS (Old Class) Priveledges Requirements
C (Technician) All modes full power No CW -- Comprehensive
above 30 Mhz. technical exam.

B (General) All modes - all bands 5 WPM CW -- Comprehensive
Power restricted to technical exam.
250 watts.

A (Advanced) All modes - all bands Hold a Class B license
Full power. for 2 years.

The way I see it, it keeps the paper-work simple for the FCC, provides an
entry into Amateur radio for both CW and non-CW interests and has only one
down side. By doing away with incentive licensing, there will be no higher
classes to look down their noses and the lowly masses.
One argument I see is that there is no guarantee that a Class B license
holder will use his 2 years to gain the experience that is necessary and
is the only reason for having the restrictions on the Class B anyway. In
fact, if a Class B user does just file his license away and never use it,
I would think it highly unlikely that he would magically develop a renewed
interest when he automatically became a Class A. I also think that the
250 Watt restriction is meaningfull when you consider the avaerage power
of a commercial bare-foot rig today fits that class perfectly.

Any comments?? Should I actually write this up and propose it to the FCC?
Should I don my NOMEX underwear??

3016. COMMUNICATIONS QUARTERLY, premier issue

Newsgroup: rec.ham-radio
Date: 1990-11-12 14:25:37 UTC
From: rtodd@thoreau.nsc.com
Message-ID: <112@thoreau.nsc.com>
Source record: 6726
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Hello all you in netland,
Terry Northup, editor of COMMUNICATIONS QUARTERLY, has just sent me a list of articles scheduled to appear in the premier issue. The following is a copy of the text of her fax. In my narrow mind :-) this looks to be a real good start for her project. You can contact COMMUNICATIONS QUARTERLY at this address:

CQ Communications, Inc.
COMMUNICATIONS QUARTERLY
Terry Northup, Editor
Main St.
Greenville, NH 03048 USA

Phone (603) 878-1441
FAX (603) 878-1951

If you like what you see, please let Terry and the other people know, the best way would be to send in a subscription.

----------Letter Follows----------

Hi Ron: Here's a list of the articles which will appear in the premier issue of Communications Quarterly. Thanks for your help in getting the word out to other hams who might be interested. The first issue has gone to the printers and first copies should be out by the end of the month.

73,
Terry, KA1STC

Communications Quarterly
Editorial Schedule
1990

NOVEMBER 1990

WD4EUI Interface Your Computer to the "Poor Man's Spectrum Analyzer"
N6NWP High Dynamic Range Receiver
WB1ALZ/N2BU A Communications System using Gunnplexer Transceivers
WA1SPI S-Parameters
G2HCG The Enhancement of HF Signals by Polarization Control
W6FR Telephome Susceptibility to RFI
K1FO 432-MHz EME
Carter Super Narrowband Techniques
NU1N DSP: Working in the Frequency Domain
W0JF The 5/4-Wavelength Dipole

K1ZJH Transmitter IMD Measurements on a Utility-Grade
Spectrum Analyzer
KB6IC Error Correction in Data Transmission
W4MB Using MININEC for Antenna Analysis

One thing I have to note after reading this is that there seems to be some good coordination of articles, there is some interrelation of the articles. Note how DSP and narrowband work can work together as can the spectrum analyzer articles. MININEC antenna analysis and the polarization control articles are a nice combination also. The combination of theory and practice is a real good touch.

You can e-mail me your comments, I am going to collect them and forward them to Terry.

73 and happy reading,
Ron Todd, K3FR

disclaimer: I am in no way connected with Communications Quarterly or with CQ Communications, Inc. I am doing this on my own hoping to further the practical exchange of Amateur Radio related technical information.

3017. Re: Genderless pronoun: na

Newsgroup: rec.ham-radio
Date: 1990-11-12 15:01:34 UTC
From: rtodd@thoreau.nsc.com
Message-ID: <113@thoreau.nsc.com>
Source record: 6627

Pardon the intrusion, I rarely get into this sort of thing. I have done a lot of canvasing of my friends and it seems that the ENGLISH language in its many variants is the only genderless language. This is to say that nouns have no gender association and that verbs conjugate without gender based rules. As far as I have been able to establish, all other terrestrial languages have gender based structure and rules: Asiatic, African, European, Oceanic and Native American, even classical and most "extinct" languages.

Yes, it is curious that we mantain links to our linguistic roots by referring to automobiles with feminine endearments, fishes and fauna with masculine explative etc. Yes, it is true that much of the language is gender oriented but, in the case of common discussion and general text it is not inappropriate to refer the "common person" as either a masculine or feminine entity. The usage of a singular gender in these cases is NOT an affront to the "common person". What is an insult to the "common person" is that such references are demonstration of insensitivity.

Indeed, any such uncontrolled speech or idea is now taken as lacking in sensitivity. As for me, my sensitivity (minimum detectable signal) has been breeched. Is it not intriguing that this thread of discussion began as a posting of non-ham activities at a convention? I will let you draw your line from that.

Ron, K3FR

3018. Re: Phone bashing

Newsgroup: rec.ham-radio
Date: 1990-11-12 15:38:39 UTC
From: gary@ke4zv.UUCP
Message-ID: <1518@ke4zv.UUCP>
Source record: 6628

In article <39522@ut-emx.uucp> oo7@ut-emx.uucp (Derek Wills) writes:
>Most phone DXing and contesting is conducted in English (well, most is in
>Amurrican but we'll overlook that). Suppose you were Japanese, didn't speak
>English, but got interested in amateur radio and DXing. Do you really think
>that learning cw in order to do cw DXing would be such a terrible thing when
>compared with having to learn English in order to do phone DXing?

Let's see "w4xxx this is ja1xxx you're 59. Please QSL. QRZ?". Change the first
callsign and you have the total knowledge of English needed by ja1xxx to work
DX. Nothing else ever changes. It probably won't take a DXer more than four
or five hours to memorize that. Then he's set for life on ham radio.

>What's my point? Just that the dislike of cw among some of the people on
>this net is probably conditioned by the fact that speaking English is not a
>problem for them. If international communications were all either in CW or
>in Japanese, you would be facing the same sort of choice that many Japanese
>face in getting on the air. It also means that if you want to work lots of
>JAs and UAs it is a good idea to stay fluent in cw.

Let's see "W4XXX DE JA1XXX UR 59 PSE QSL QRZ?" The DX exchange still looks
like English in CW, it just takes longer to send. Course you could program
a memory keyer so you could be catching up on your log while the "communication"
is taking place.

>I don't see a lot of difference between the attitudes "they should all learn
>my language" and "I shouldn't have to learn cw", or, for that matter, "why
>can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you
>probably can).
>
>I understand that this is not addressing the current requirement to learn
>cw in order to make "I'm on my way home, honey" calls on 2 meters, but the
>no-code thing goes further than that, I think. Most anti-code people would
>like to see the cw requirement dropped for HF operation, and the next logical
>step would be opening the cw bands for phone operation. Meanwhile, a good
>fraction of all the "foreign" stations will still be using cw because it is
>easier than learning English for many of them.
>
>I also realize that I am equating "HF operation" with "DXing" but I think of
>them as the same thing. I don't go on 20m in order to talk with people in
>the same country, although some people obviously do - they need professional
>help :-)

I agree with Derek that content free contacts can be done as easily with
CW as with phone, it's just slower and more tedious and you have to learn
a manual encoding method to do it. But I believe that real communication
of real ideas is more important than content free DXing. To do real

communication both parties must share a common language of ideas, a natural language, and not just a common encoding method. Real conversations conveying real ideas are possible using Morse encoding, or RTTY encoding, or even voice, but a common natural language is a necessity. The only modulation methods that can convey ideas between people that don't share a common natural language are pictorial (SSTV, FAX, FSTV). And even then visual symbols don't always translate into the same internal natural language ideas.

Derek, if the sum of your HF ham radio experience is limited to DX exchanges, you're missing out on a grand opportunity to learn what the rest of the world thinks and feels. It's worth your time to learn a little conversational Russian, or maybe your college German or high school French will come back to you with a little practice. You know, some parts of the world even speak English, like Australia, New Zealand, the subcontinent of India, South Africa, even England. It's estimated that nearly 80% of the world's population knows at least a little English. Try actually talking with some of them, you might enjoy it.

3020. 900 MHZ TX on 24AT (Was Dual band antennas for an HT)

Newsgroup: rec.ham-radio
Date: 1990-11-12 15:54:11 UTC
From: vail@tegra.COM
Message-ID: <1725@atlas.tegra.COM>
Source record: 6630

In article <2451@dover.sps.mot.com> waters@darla.sps.mot.com (Strawberry Jammer) writes:

What I did was to buy the Diamond dual bander (yes I know - $$$, but then
the 24AT isn't peanuts either!). Its around 15 inches long and actually has
a GAIN rather than the loss you see with a "duck". Only disadvantages are
the price (around $75 as I recall) and the size which makes it hard to

I think they go for about 1/2 of that. I have one and I don't
remember paying that for an antenna.

Remember you ae losing two ways with the ICOM "rubber duck" - its shortened
AND its dual band. Should still hit the stronger repeaters around though.

I don't believe that there is anything inherently bad with a dual band
antenna. The makers frequently make compromises but there is no
reason that a dual band antenna has to be worse.

To change the subject slightly, I have heard two rumors now that there
is a mod for the 24 to allow real out of band TX, like 900 meg!!! I
have performed all the mods I know about and although the freq range
was greatly extended it did not include 900 meg for tx. Has anyone
found this mod and tried it?

Message-ID: <1990Nov12.112155@koning.enet.dec.com>
Source record: 6632

As a data point: I believe Austin Custom Antennas uses PVC pipe in several of its designs, as the "radome" outer covering. One comment was that it stands up to certain types of harsh weather (sandstorms? Bright sun? I don't remember...) better than fiberglass.

So you should be in good shape with that approach, provided the piece of PVC in question passes the microwave oven test.

I suspect the reason for the phone numbers was so that the "business" aspects
like "How many $$$?" and such could take place off the air, where most hams
believe they belong.

Many local repeaters also have a swap net on a weekend night (ours is sunday)
and go through "Have" and "Want" lists, updating them... yes, phone numbers
here too...

You may want to inquire locally about such a net on 2 meters, and try that as
well.

Yes PVC pipe is sometimes quite lossy (depends what the manufacturer uses as a 'filler' material). I once wound an ATU coil on some PVC pipe, it made a fine dummy-load.
Polypropylene pipe (as used for domestic plumbing, as opposed to rainwater) is probably a better bet; i have used the small-bore stuff for antenna loading coils in the past (make up end-plugs out of short lengths of alloy rod to take the whip elements). Only problem is, in long lengths the pipe is quite flexible. Maybe this would be an advantage in windy locations?

3027. *sigh* another urbane legend

Newsgroup: rec.ham-radio
Date: 1990-11-12 17:38:56 UTC
From: pardo@CS.WASHINGTON.EDU
Message-ID: <9011121738.AA18033@june.cs.washington.edu>
Source record: 6637

Recently there was a notice saying

Craig Shergold ... is a seven year old boy with an inoperable
tumor on his brain. He has not been given a very long time to
live and it is Craig's ambition to enter the Guiness Book of
World Records for the largest number of get well cards ever
received by an individual.

Please send your card to: ...

The story is almost certainly an urban legend. There is a reasonably
good chance that Craig Shergold does not exist. If he does exist,
there is a very good chance that he doesn't want a jillion postcards
raining down on him.

As has been widely documented, (see e.g., Brunvand's books on urban
legends; I don't remember which one has ``the story of David''), there
are a long series of stories just like this, usually about a young male
child named `David'. `David' is allegedly dying of an inoperable brain
tumor whose ambition it is to get the largest number of postcards and
make it in to Guiness before he dies. `David' usually lives in Florida.

Usually, there is no such child. In one case, there was such a child,
he was not dying of a brain tumor (or anything else), and he was
royally pissed off at getting thousands of unsolicited and unwanted
postcards.

The legend is pervasive enough that it requests for postcards have
shown up in newspapers and on radio. There have been several such net
postings for postcards. One was so widespread that the moderators of
``news.announce.important'' (which goes to all sites in the world and
has only a few articles a year) had a request to please ignore the
rumors.

What should you do? Two things. First, don't send a postcard.
Second, tell everybody that you've told -- and everybody who told you
about the card request -- that this is an urban legend and not a real
story.

;-D on (Now about this bridge with a tumor...) Pardo

Dear NetFolks,

We would appreciate your responding to the request of Craig Shergold who
is a seven year old boy with an inoperable tumor on his brain.

He has not been given a very long time to live and it is Craig's ambition
to enter the Guiness Book of World Records for the largest number of get
well cards ever received by an individual.

Please send your card to:

Craig Shergold
% Children's Make-A-Wish Foundation
32 Parimeter Center East
Atlanta, Georgia 30346

==========--

Letters similar to this have been sent out by traditional mail to large
organizations all across the U.S. on Craigs behalf. Instead of passing
it on by land-mail, I thought the net would be a great way of getting
the word out to as many people as possible in as short a time as possible.

Please pitch-in & send Craig a get well card, and by all means feel free
to circulate this letter to local businesses/organizations, or other
BBS's you may belong to. All your help and effort will certainly be
appreciated! Thank you.

Sincerely,
Jack Petrino

Response to: Phone bashing (Derek Wills)

> What's my point? Just that the dislike of cw among some of the people on
> this net is probably conditioned by the fact that speaking English is not a
> problem for them. If international communications were all either in CW or
> in Japanese, you would be facing the same sort of choice that many Japanese
> face in getting on the air. It also means that if you want to work lots of
> JAs and UAs it is a good idea to stay fluent in cw.

If you stick to Q-codes and RST reports, CW is a universal language. CW does not, however, magically translate Japanese into English (a popular misconception).

> I don't see a lot of difference between the attitudes "they should all learn
> my language" and "I shouldn't have to learn cw", or, for that matter, "why
> can't you get a decent hamburger and fries in Burkina Faso?" (sadly, you
> probably can).

So why NOT learn their language?

I started to work towards 20 WPM after passing the Extra written test 2 years ago. A year later, I could copy around 10 WPM, and credit for the written portion expired. I don't work CW by choice, and I find tapes, computer generated code, W1AW too boring to stick with.

Instead of code, my current project is to try to recover some of the foreign language knowledge I had in high school and college. I've ordered the Amateur radio phrase book form the Finnish Amateur Radio League, and I'm listening to QSOs in other languages while I'm waiting. Why bring this up? I think that it would do wonders for "International Goodwill" if English-speaking hams could say even a sentence or two in the language of their contacts.

> Meanwhile, a good fraction of all the "foreign" stations will still be using
> cw because it is easier than learning English for many of them.

If all they want to do is exchange callsigns and signal reports.

rtodd@thoreau.nsc.com (=Ron Todd) says:

Summary: Genderless Language

..... Is it not intriguing that this thread of discussion
began as a posting of non-ham activities at a convention? I will let
you draw your line from that.

Ron, K3FR

Actually, that's not true. The only link is that I initiated both subjects.
I posted something about non-ham activities at a hamfest being entirely for
women, and I later posted something about DXing certificates referring to
"his station" etc. There are not many women in ham radio, and I think both
of these situations perpetuate the idea that hamming is an all-male hobby.
It's not only in this country, either - all I have to do is to send my call
at someone in response to a CQ, to get "GE OM, tnx fer call" - and you can't
tell me that women and men sound different on cw. People even have QSL cards
printed with "tnx for QSO OM". Not all hams are middle-aged white males with
beer bellies and baseball caps. Changing the wording on certificates seems a
minor thing to do, yet I've seen many postings from people who tell us that
"his" means "his or her" and it's perfectly OK to refer to "his station" on a
certificate awarded to a female ham. Am I just unusually enlightened or some-
thing? ...

BTW, the above is not meant as an attack on the poster - I read his posting
a few times and still don't understand what he was saying :-)

Argue all you want about the merits of testing for CW as a prerequisite for getting a HAM license, but there's something missing if you don't know and use it.

I passed my General CW portion on a wing and prayer, and I never intended upon using CW since I love computers and digital modes. But, have you ever noticed how educated and truly noble many of the CW operators are? They are very courteous and most love to help Hams develop their CW skills. CW operators are getting statistically older as younger Hams opt for the easier modes. I love talking to these older guys. They have such a wealth of knowledge and experience that is unique to CW. Many of them only use CW. I could listen to their old stories for hours.

I want to meet more of these Hams before they leave the hobby, for whatever reasons. So, if I have to learn CW (25 wpm) do it, I'm gonna. And I know I'll be glad I did. Extra class, look out!

I hope CW never dies and that CW operators continue to epitomize what's good and fascinating about Amateur Radio.

Several years ago I heard an unidentified piece of music which piqued my curiosity and I since then I have wondered about just who it can be attributed to as well as any background on it. Let's see what those of you who provided so much information on YYZ last summer (as well as any others) can come up with on this one.

The recording starts up with the sound of atmospherics and several hissing (no BFO) CW signals. It sounds like a receiver with a wide IF and an AM detector parked in the CW portion of one of the HF marine bands (8 MHz for example). Then a female voice comes in reading what sounds like a marine weather report only to drowned out by the band.

Throughout the whole song the lead guitar cranks out SOS in Morse.

My memory of the lyrics is sketchy, but I do remember that the word "stranded" is used heavily, probably more frequently than any other. Another line I recall is "better get the breakdown squad out, to get me rollin' on", or something like that.

The piece ends much like it began, except in reverse order. The weather report fades into the CW through an AM detector and noise and this then fades into silence.

I heard this music on a cassette which belonged to a young man who was several thousand miles from home at the time. He said that he had recorded the tape from an album belonging to his brother and that he had no idea what who the artist was or what the name of the slelection was.

Does anyone on the net recognize this piece, know its name or who the artist is? If so, can anyone offer any further background. Its been nearly eight years now and I still don't have a clue.

73, Scott

>portion and just leave CW, USE, and LSB (packet)
^^^^^^^^^^^^

Does it really matter which mode (USB vs LSB) one uses for
packet? Using LSB vs USB could invert the tones (mark vs. space), but
that shouldn't matter given the NRZI encoding of packet data (NRZI encodes
data in transitions, not absolute mark vs. space). On 2m, I've seen stations
which have the tones flipped with respect to each other; it doesn't make
a difference there (as one would expect).

Then again, I've never used HF packet :-)

PROPAGATION FORECAST BULLETIN 46 ARLP046
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 12, 1990
TO ALL RADIO AMATEURS

DURING THE FIRST WEEK OF NOVEMBER THE SOLAR FLUX ROSE FROM A LOW OF
140 TO A HIGH OF 215. IT THEN DROPPED BACK TO 193 ON THE 10TH BUT
RECOVERED TO 197 THE NEXT DAY. SO FAR THIS MONTH CONDITIONS HAVE BEEN
GENERALLY GOOD, EVEN UP THROUGH 50 MHZ, WHICH WAS QUITE BUSY THIS
PAST WEEKEND.

FOR THE PERIOD BEGINNING NOVEMBER 6, THE FLUX HAD REACHED 190 OR
HIGHER WITH A PEAK OF 215 ON THE 7TH. IN NOVEMBER THIS IS HIGH
ENOUGH FOR 50 MHZ DX AND FINE FOR WORLDWIDE WORK ON 28 MHZ. IT IS
NOT TOO HIGH FOR MOST OTHER DX ACTIVITY. THE MUF MIGHT FALL BACK
SOME DURING DECEMBER, BUT THE DX PICTURE SHOULD REMAIN GENERALLY
GOOD THROUGH EARLY SPRING.

FOR MORE ON THE DX PICTURE WE RECOMMEND USE OF THE CHARTS THAT
APPEAR IN EVERY ISSUE OF QST, USUALLY NEAR THE DX COLUMN. THE SIZE
OF THIS FEATURE HAS BEEN REDUCED BECAUSE SURVEYS HAVE SHOWN THAT FEW
AMATEURS MAKE GOOD USE OF IT. THIS MAY COME TO A, "USE IT OR LOSE
IT," SITUATION IF EVIDENCE SHOWS THAT MANY READERS CONTINUE TO PASS
IT BY.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 1 THROUGH 7 WERE 71, 96, 113,
136, 158, 161 AND 198 RESPECTIVELY, WITH A MEAN FIGURE OF 133.3.
SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE
145, 140, 151, 156, 170, 198 AND 215, WITH A MEAN FIGURE OF 167.9.

>>Gary KE4ZV

Hey, I didn't say that I was guilty of this attitude, did I? I've used
French over the air in working some African and European countries - the
most recent occasion was with a Belgian, who pretended not to understand
because he was from the "wrong" part of the country (bit of a faux pas
there, I suppose). I have ragchewed (by which I mean spent more than
5 mins on a QSO :-)) with stations in all continents. I was the only
participant to make an admittedly short speech in Chinese at a conference
in Beijing (nobody really understood it, including the BYs, but I tried).
I use the Chinese words for 'hello' and 'thank you' when working BYs on
phone or cw. I've sent foot in all the countries you mention above (except
for South Africa) and conversed with the natives. So I'm not as parochial
as you might be implying. I'm even married to a foreigner (well, a VK3).
Heck, I've even corresponded in French over e-mail (right, Patrice N6BIS?).

However, my point in the original posting was that having to learn a small
amount of a foreign language is at least as difficult as having to copy cw
at a measly 5 words per minute. All the postings I've seen in response have
agreed that learning said smattering is easy and rewarding and helps one make
contacts with 'foreigners'. I agree completely and think the same can be said
for learning cw, except that 5 wpm doesn't get you very far in any language,
including cw (as Julian N6ARE said in a posting, or perhaps it was in e-mail,
it's like trying to hold a conversation by looking up one word at a time in a
dictionary).

I guess I'm saying that "I don't have time to learn 5 wpm cw" is just like
"I don't have time to learn the French for 'please', 'thankyou' or '73' ",
whereas in both cases a little effort can repay enormous rewards in what you
can achieve in international communications.

Now I suppose we'll get flames from those who can speak fluent Serbo-Croatian and Mongolian, but just can't handle dots and dashes :-) [and to forestall the expected, yes, I know that learning the basics of a foreign language is not required for a ham license while 5 wpm cw is...].

In <phil@ux1.cso.uiuc.edu (Phil Howard KA9WGN)> Phile opines:

(lotsa stuff ref <rec@chiton.ucsd.edu (Richard Currier)> deleted)

>Now here's something you can flame me for...

I wasn't going to get into this again, but I couldn't turn down the invite.

>(pro-coders are) selfish and arrogant.

No-coders are selfish and arrogant.

>You want to keep ham radio stuck in the way of the past that will doom it.

Did this come to you in a divine revelation, or isn't it just your opinion?

>You may have the best of intentions, but I don't think you
>know and understand what the future of the hobby has going for it in the next
>fifty years.

I don't think you do, either.

>The loss of valuable spectrum we can see each time the FCC says
>something is a direct result of the lack of growth because of efforts to keep
>out anyone not willing to become like you.

"Lack of growth" is due to a large variety of things, chief of which is the
TV, "Nintendo" games, and computers. I don't buy your argument that the
need to copy Morse at 5 WPM is the direct cause.

>So what conclusions can I draw?

The wrong ones, IMHO.

>I work VHF, UHF, and planning to go digital, and am also interested in VHF
>thru SHF SSB and CW and I am appalled by what I hear. How can I not associate
>a "stick to traditions only" thrust with a knife in the heart of the Amateur
>Radio Service.

If a "stick to tradition" attitude is a knife in the heart of amateur radio now,
why was it not so in earlier years? Why, oh why, must we be constantly be
propagandized with the idea that tradition is bad? Progress has been, and will
continue to be, made while holding to traditions.

>I hope I'm wrong. I hope I'm just paranoide. But why do I
>keep spinning the dial down to the HF bands and hear people who make me feel
>bad instead of feeling profoundly proud?

Why do I keep spinning the dials up to the VHF and UHF bands and hear people who make me feel bad instead of feeling profoundly proud? There are bad attitudes and rotten apples all over, that's why; and I certainly can't see a no-code license improving THAT.

The point is, that none of the foregoing hyperbole is selling no-code, (or, for that matter, pro-code) and few people seriously believe that no-code is the panacea that will rescue amateur radio from (moot) death.

73,
Dube N5PDK

How comprehensive is "comprehensive"? I would hate to see Novice level entry eliminated altogether. On the surface, it looks like your plan would do just that.

Also, I would reduce maximum power to 200 watts for everyone. There's no earthly need for more than that and hasn't been since hams quit operating on 600 or 700 meters with rotary spark gap transmitters.

3045. Realistic PRO-2006

Newsgroup: rec.ham-radio
Date: 1990-11-12 23:57:05 UTC
From: root@raider.raidernet.com
Message-ID: <19@raider.raidernet.com>
Source record: 6655

I recently purchased a Realistic Pro-2006 scanner and am very pleased with it. Now I want to combine it with my other hobby - computing. Is there any way this unit could be interfaced to a computer ? Does anyone make a kit, or has someone out there done it before ?

In particular, it would be nice to let the radio scan and have the computer log active frequencies for later research. Scanning is great fun, but it seems to be a perfect place for automation !

On another note, anyone have a list of mods for this radio they could mail to me - I've heard of a few possibilities that are supposed to exist, but have no particulars.

Thanks for any help !

Bob

>I think I have the perfect solution.
>
>Access to the CW part of the spectrum should be permitted only to
>those who know the Morse code.

The CW part of the spectrum is also commonly used for other modes, such as RTTY, HF packet, FAX,... Fragmenting the spectrum for a CW-only band (where no other modes are allowed) would be a waste of a shared resource.

>Access to other parts of the spectrum should be permitted only to those
>who have the appropriate skills. E.g., only people who can speak
>should be allowed to use phone, only people with functioning EME
>equipment should be allowed to bounce off the moon, etc,

Is this a variation of "if you can buy the equipment, you can use the resource" ? That idea sounds like elitism, although it does somewhat reflect the current reality.

"Appropriate skills" sounds like a variation for multiple operating test elements to replace the code element. That would drive the VECs buggy, and/or make it difficult for a prospective ham to find a VEC that could test him on his favorite mode.

>It's silly to require people to learn the Morse code in order to just
>be allowed to talk.

Tell it to the WARC - they're the ones that require Morse of HF users.

Re: Is he licensed ?

Good question ! What is your call sign, Karl ? If you don't have a license, come clean. A little study will yield a Novice or Tech ticket, and then you can do this legally on less-crowded frequencies. It's really worth it. Just some friendly advice from an ex-freebander.

Re: Will 40 watts really allow you to "talk some skip" better than 25 watts?

Karl, save yourself some $$$, and forget about the extra 15 watts. It will raise your transmitted signal less than one S unit. 10*log10(40/25) ain't much.

I've used 400 watts (vs 100) on 10 meters. Presumably, it should account for 6 dB more signal, but it's a waste on 10 meters. 10 meter propogation is a binary affair - either you do or don't, and no (reasonable) amount of extra power will help if you don't.

Perry / KF0CA

3048. Phone patch by automatic repeater NOT LEGAL

Newsgroup: rec.ham-radio
Date: 1990-11-13 01:06:08 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1990Nov13.010608.8311@ux1.cso.uiuc.edu>
Source record: 6658

97.205(e) Ancillary functions of a repeater that are available to
users on the input channel are not considered remotely
controlled functions of the station. Limiting the use
of a repeater to only certain user stations is permissible.

Now the question is how to interpret the first part of this rule.
One important question is what this rule means with regard to the
autopatch functions of a 2 meter repeater. What is not clear is
whether or not SOME control is still required, and if so, what kind
of control that must be. We need to look elsewhere to resolve this.

97.201(d) An auxiliary station may be automatically controlled
only when it is part of a system that includes a
repeater station also being automatically controlled.

While this should easily allow for auxiliary links to other repeaters
and to access a phone line remote from the repeater itself, it might
not apply well to a case of the phone line attached to the repeater.

97.115(b) The third party may participate in state the message where:

97.115(b)(1) The control operator is present at the control point and
is continously monitoring and supervising the third party's
participation; and

97.115(b)(2) [restrictions on who may be third party]

This rule effectively requires a live, breathing, and licensed, human
being to monitor the third party traffic. A phone line could be used
as a control link to the transmitter, but only if the person at the
other end of it is being the control operator. This is usually not
the case and would fall under third party traffic.

So we can operate a repeater (and its associated auxiliary links) under
automatic control, but we still need a real control operator if the
repeater station is originating third party traffic. Even though
97.205(e) does not require the user be operating an auxiliary station
just to use features of the repeater, 97.115(b)(1) still requires that
a control operator be present somewhere.

97.109(e) No station may be automatically controlled while transmitting
third-party communications, except a station retransmitting
digital packet radio communications on the 6 m and shorter
wavelength bands. Such stations must be using the American
Radio Relay League, Inc. AX.25 Amateur Packet-Radio Link-Layer
Protocol, Version 2.0, October 1984 (or compatible). The
retransmitted messages must originate at a station that is

being locally or remotely controlled.

Well, that seems to completely exclude the possibility of an autopatch on an automatic repeater being legal. The automatic control aspect a repeater is usually operating under cannot be used to pass third party traffic. There must be a station who is the control operator (can shut down the station) who is monitoring the third party traffic. It is not control of the repeater that is at issue, but control of the third party traffic. The last part of 97.109(e) also indicates that even for packet, a real live control operator needs to be monitoring the introduction of messages into the packet network; a philosophy indicated in the rules that is consistent with the repeater situation.

The ARRL License Manual (which every ham who does not have any other copy of the current FCC rules owns, right? :-) talks about phone patches on pages 13-16 and 13-17 (8th edition). In the entirety of that discussion no mention is made of a phone patch being done via an automatic repeater. However on page 10-3 they do refer to control of a repeater, quoting:

Only a digipeater operating at 50 MHz or higher can be automatically controlled when it is passing third-party traffic. A third party participates in amateur communications when you make a phone call with a repeater autopatch. This means that a voice repeater must be locally or remotely controlled and a control operator must be present at the local or remote site when the repeater autopatch is active.

So, I am not the first person to come to this conclusion. I'd have expected the ARRL to figure this out well before me since they have the "inside track" and a lawyer or two to go over it all.

Now of course the user of the "repeater" can become the control operator and take on the duties specified in 97.115(b)(1) but to be the control operator, a wireline (hard to do portable) or a radio remote control is needed. 97.205(e) simply means you don't have to be remotely controlling the actual functions of a repeater to use them. You can turn ON the phone patch and say something INTO it, and that much would be OK. But as soon as someone on the phone end says something, it becomes third party traffic. You have to become the control operator of the repeater, not just merely be the user of it, to allow third party traffic. Alternatively someone else can be the control operator. If the control operator is using a radio link to effect the control, that radio link must be an auxiliary station. If the user is doubling as a control operator, his control must be by means of an auxiliary station operating under the rules of an auxiliary station including the limitation of being on the following frequencies:

220.5-225 MHz, 420-431 MHz, 433-435 MHz, 438-above MHz

If the repeater input is on one of the above frequencies, I see no reason it cannot double as being the control link. Provision would have to be made to make sure the user of such an input can hear the third party traffic at all times that it is being passed. That might mean that the

phone connection is cut off during the time the user/control-op is sending. That would be a convenience in the repeater that makes it easier for the control operator to meet his legal obligations without full duplex capability.

Sorry folks, but thems the rules. Interpret them as you see fit, since in the end, that's your responsibility, and it is your license. The above is just how I interpret them for my own purposes. My autopatch control link will be on an auxiliary frequency only.

If you think the rules need to be changed, you can petition the FCC to change them. I personally feel they should be changed, but am not sure just yet exactly how. I welcome contact about this matter.

> Full power. for 2 years.

A couple of questions:

1. Do you mean to restrict the power for ALL bands for class B or just
for the HF bands?

2. Why do you choose 250 watts instead of the 200 watts Novices and Techs
now have as power limits (and everyone has on 30m)?

>Any comments?? Should I actually write this up and propose it to the FCC?
>Should I don my NOMEX underwear??

I'd have chosen 150 watts if a change was necessary. That makes for a nice
round ratio of 1:10 for power between A and B.

The NOMEX might be a reasonable precaution. There are a lot of people
out there that want to hold on to their (H)igh (A)am (M)ighty status. :-)

RTTY DX Notes 1of3 11/9/90

RTTY DX Notes for week ending 9th November 1990
BID: $RTDX1109
Part 1 of 3.

Last week I made mention about reading books to see what AMTOR was all
about. There are several good books to read. There is one written by
G3PLX, Peter Martinez, which explains the protocol between stations,
and some of the commands. But for the actual working of the AMTOR
system it is suggested that you read and study CCIR Recommendation
476-4. That tells you nothing about commands (each system has its own
series of commands) but it will tell you how the AMTOR system works in
detail. Its worth reading if you are not just a black box basher.

Our thanks this week go to DJ3IW, DL8AAM, I5FLN, JA1BLV, OD5NG, TG9VT,
VK2EG, W2JGR, W2UP, and the Tristate DX Packet Cluster Network.
Thank you all for your assistance and news.

UI9ABV 14083 at 0450Z
P29BT 14084 at 1411Z QSL

QSL Information:

PJ2/OH2BGD will QSL via his home call.

HK0TU says to QSL via HK3DDD.

UC2OCJ collects his cards from Box 68, Gomel, Byelorussia 246027 USSR.

J73WA is Wayne Abraham, 1430 Rodney St., Portsmouth, Commonwealth Of Dominica, West Indies.

CN15AMV will QSL via Box 299, Rabat, Morocco.

Notes of Interest:

Banaba T33 should be active now, but nothing heard so far.

Juan Fernandez. CE0ZZZ should be active this week. QSL via CE3BFZ.

You can stop holding your breath: cards for YV0AA have started to appear. One wonders how long before other cards for the April period of operation will take to appear?

Angola. There are some rumors around that there may be activity from this area in the near future. We hope for the best.

3W3RR states that he hopes to operate from Spratley in December for a ten day period. But, he needs donations, which may be sent to NT2X, Ed Kritsky, Box 300715, Brooklyn, NY 11230 USA. In case of cancellation all donations will be refunded.

CN15AMV was operating from the capital of Western Sahara. Does this count as Western Sahara (SO) or CN8? If it counts as CN Morocco then we have two countries with the same QTH? Or something.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

The ARRL Letter Volume 9 Number 22 November 2, 1990 - Part 1 of 4

LEAGUE PROTESTS COMMENT DEADLINE TO FCC

The ARRL has filed a an "Application for Review" with the FCC, requesting the commissioners overrule a staff decision. The League seeks more time to respond to proposals for new Morse code testing procedures for disabled persons.

This is the latest episode in PR Docket 90-356, which began with a public announcement by the FCC in early August and culminated in the FCC's denial, on Sept. 28, of the League's request for more time--until Nov. 15--to comment.

The League has from the very beginning stressed that, since new procedures were implemented for disabled applicants immediately upon the August announcement--and some other accommodations have been in effect for years--there is no urgency in formalizing them through rule-making.

The League maintains that because of the unusually short time frame between public announcement and comment deadline, ARRL found it nearly impossible to study the proposal, seek comment from individual examiners to gain from their experience, and formulate comments on the proposal.

Because of "the significance of the proposal to the Amateur Radio Service," the Application said, the League felt additional comment time was a necessity, not a luxury.

The League pointed out that the main sources of information available to amateurs--the monthly magazines--simply were unable to publicize the matter in time for examiners and the disabled themselves to comment.

Furthermore, the Commission broke with tradition in this matter. In the past, proposals likely to have strong impact on the Amateur Service always have been afforded a reasonable comment period.

"This proceeding is not merely a simple matter of attempting to accommodate the needs of the handicapped by waiving an inconsequential examination element," The Application for Review said. "It is, rather, a reversal of stated policy, and an action which stands to jeopardize

the integrity of the volunteer amateur radio examination program."

The Application went on to again point out that procedures already in place for accommodating disabilities are producing applications for waivers, some of them frivilous. The list of disabilities (from the Disabled Americans Act of 1990) is overly broad, many of the disabilities listed having no bearing on someone's ability to use Morse.

As a result of the August announcement, one waiver application--with a letter from an optometrist--sought relief from the Morse requirement for an applicant with a vision problem. A problem correctable with eyeglasses.

The League also noted again that the FCC, in 1982, held that "(s)electing a particular group of license applications for favorable treatment in terms of less stringent amateur operator requirements would not be sound licensing policy...if such a policy were instituted, the Commission ultimately could find itself in the untenable position of deciding which applicants actually qualified for telegraphy exemptions and which did not. Commission personnel clearly are not trained to make such judgments..."

And so it is that the FCC now proposes to turn what, in 1982, was "not sound licensing policy" into a rule eight years later.

The Application for Review asks for an additional 48 days for comments to be accepted by the FCC.

RINALDO IN EUROPE FOR WARC

The technical foundations for WARC-92 are being laid at a series of meetings under the auspices of the International Radio Consultative Committee (CCIR). The CCIR is the part of the ITU structure responsible for making recommendations on technical and operating matters relating to radio communication. The meetings ultimately will result in a concise reference document that will be used as a basis for decision making at WARC-92.

A CCIR Joint Interim Working Party meeting was held in Geneva Oct. 22-25 to draft the section of the report dealing with the compatibility of various high-frequency (below 30 MHz) radio services. This section of the report is important to amateurs because of the different regional allocations to the broadcasting and amateur services at 7 MHz, and because broadcasting expansion may result in increased sharing of HF spectrum between other services.

ARRL Technical Development Manager Paul Rinaldo, W4RI, attended the meeting as a member of the U.S. delegation. Participating as an observer for the International Amateur Radio Union was IARU Region 1 Vice Chairman Wojceich Nietyksza, SP5FM.

with the mobile and mobile-satellite services and their present and
Another important CCIR Interim Working Party meeting, this one dealing
potential sharing partners (including the amateur and amateur-satellite
observers) will open in Helsinki Nov. 12. Rinaldo is on the U.S.
delegation to this meeting; representing IARU will be Capt. Charles
Dorian, W3JPT.

The outputs of these and other CCIR Interim Working Parties will be
fed, for final review and approval, to a special "JIWP WARC-92," which
is scheduled to meet in Geneva in March 1991. The objective of ARRL and
IARU participation in the work of the CCIR is to ensure that the report
adopted at that meeting adequately reflects the continuing spectrum
needs of the amateur and amateur-satellite services.

OFFERS HOPE TO DISABLED

People with severe physical disabilities are now able to communicate
using a Morse code-based system developed at the State University of
New York at Buffalo (UB). People unable to speak or to move their limbs
can communicate with an Apple computer by sending CW to the
computer--by moving their heads from side to side, closing
switches--according to UB Today, a publication of the university.

Develoed by S. David Farr, associate dean of the school's graduate
school of education and director of its Learning Technologies
Laboratories, the system's CW input to the computer replaces the
computer mouse. Farr initiated the project, called Morse Writer, in
1985, for Matthew Stein, now 13, who has had cerebral palsy since birth
and is a severely-involved paraplegic, according to UB Today.

Matthew uses the system in two ways. "Message mode" is a form of
shorthand in which, for example, sending the letter "z" produces "thank
you," and "o" means "hello." Used in free-typing mode the Apple
on the computer screen, produce printouts, and speak via a voice
synthesizer.

MacIntosh becomes a word processor. Matthew's system can display type
Many people have seen the physicist Stephen Hawking, the author of "A
Brief History of Time," use a similar device. Hawking, who suffers
from Lou Gehrig's disease and is unable to speak, types commands into a
computer, which activates a voice synthesizeb.

Closer to home was the late Cliff Corne, K9EAB, who for years was
confined to an iron lung and sent CW using his mouth to operate a keyer
paddle. This was in the 1960s, before the microcomputer.

Today, sophisticated hams using computers and digital voice keyers are
able to operate on voice modes without ever speaking a word.

AMATEUR RANKS CONTINUE GROWTH

Both new Amateur Radio licensees and license upgrades showed a healthy
increase in the past year. FCC statistics for the fiscal year ended
Oct. 1 have been released (statistics actually were compiled through

1990 1989 1988 1987 1986 1985

Sept. 25) and are shown below along with the five-year trend.

New 26,134 23,065 21,080 24,338 20,979 17,373
Upgrades 29,699 26,789 26,342 23,814 22,228 16,184

The total number of amateur operator licensees grew 6.1 per cent, from 464,800 to 493,292. Here is the breakdown by license class:

Total

Extra 52,847
Advanced 104,365
General 119,158
Technician 125,217
Novice 91,705
Total 493,292

PANELIST SCORES FCC METHODS

FCC Commissioner Ervin Duggan has called for sweeping reforms to disperse the "concentrated" power of the FCC chairman and restore "truly collegial decision making" at the agency.

The Commission has evolved into "a top-down, one-option process of deliberation, a frustrating and often stultifying parody of collegiality," Duggan told a meeting of the Federal Communications Bar Association.

Duggan's recommendations include:

[] Reform of the post-Watergate "Sunshine Act," which prohibits more than two commissioners from meeting in private.

[] Restore independence to bureau chiefs.

[] Require bureaus and offices to work with all commissioners, not just with the chairman.

[] And, encourage staff in other bureaus or offices to present "associate or companion" items in proceedings to develop alternative solutions.

The other three FCC commissioners, Sherrie Marshall, Andrew Barrett, and James Quello, who also attended the meeting, were generally supportive of Duggan's ideas. Quello, however, noted that "It's Congress, not the FCBA," that will have to make any changes in the way the FCC conducts its business.

Last May nine members of the Harvard Wireless Club (W1AF) travelled
HARVARD CLUB HOSTS SOVIETS

6,000 miles to Leningrad and operated for 10 days from club stations UZ1AWT and UZ1AWX. Working alongside Soviet operators under the call

sign US1A, the group made some 21,000 contacts and many new Amateur Radio friends. The event was hosted by the Leningrad Institute of Aircraft Instrumentation.

Immediately upon his return W1AF trustee Mike Manafo, K3UOC, resumed planning for a reciprocal visit by the Soviet club members. "An event like this is not to be taken lightly," Manafo said. "It was six months of very hard work.

"This also was probably the most significant happening of my life," he added.

In mid-October seven Leningraders arrived in Boston for Part Two of this exchange. Although the long-awaited U.S.-USSR reciprocal operating agreement failed to materialize, the Soviets were able to participate in Amateur Radio at W1AF under third- party rules.

On Oct. 23 the Soviet club members visited ARRL Headquarters, with hosts K3UOC and NZ1W. Following a tour of the lab, the QSL Bureau ("Box 88, Newington"), and W1AW ("It's a pileup!" one of the Soviets exclaimed), the group exchanged mememtos with ARRL Executive Vice President Dave Sumner, K1ZZ, and W1AW manager Eddy Pollock, W6LC.

Back in Cambridge, five of the Soviet club members battled the language barrier to become U.S.-licensed hams. They were: Dmitry Samrin, UA1CFL (Novice); Vladimir Alexandrov, UA1AIU (Novice); Sergei Hrapenok, UA1ABR Ivliev, UA1ALZ (Advanced).

(Technician); Victor Stroganov, UV1AA (Technician); and Alexandr
The Leningraders' U.S. visit coincided with a rebuilding program at the HWC station--which now includes new HF gear and antennas donated by several Harvard alumni--and with the *CQ* Worldwide SSB DX Contest. The Soviets joined eight U.S. operators for a multi-single contest entry.

"The computerized operation, including both contest software and the PacketCluster spotting network, was pretty daunting for the Russians," Manafo said. (It's daunting for *anybody* using it for the first time--ed). "But they loved it," Manafo said. The W1AF operation netted three-and-a-half million points.

Following the contest, the group visited several expatriate Leningraders in the New York City area, and were scheduled to return to the Soviet Union Nov. 1.

OHIO AMATEUR BATTLES ORDINANCE

Another municipality has found federal law to be on the side of Amateur Radio operators. Rocky River, Ohio attempted to apply three separate ordinances to keep the 30-foot tower of James D. MacMillan, WA8ZHN, on the ground, after his application was rejected by both the building commissioner and the board of zoning appeals.

The town held that the proposed tower would decrease real estate values, was too close to the side lot line, and that certain technical

information was missing from MacMillan's application.

According to MacMillan, "the problem with the zoning code is not the 60 foot height limit, but (rather) a provision that the neighbors have a right to protest because they don't like the tower for whatever reason."

This ordinance represented "discrimination under the color of law," MacMillan said. The city "can arbitrarily discriminate based on the whims of the neighbors."

In overturning the town's rejection of MacMillan's application, Judge Frank J. Battisti held that the city did not apply the zoning laws in such a way as to provide for reasonable accommodation of amateur communications. The court said there was no violation of the height ordinance with respect to the distance from the side lot line because the city has interpreted it incorrectly. The federal court also refused the city's request to relinquish jurisdiction to the state courts.

MacMillan was represented by ARRL Volunteer Counsel Robert M. Winston, W2THU, who has won several other tower cases in the Cleveland area. "We have won the battle, but not yet the war," Winston said, because the a tower."

BRIEFS

court has not yet ordered that Rocky River issue a permit to construct [] A special effort to reduce a sizable backlog in DXCC submissions has begun at HQ. Coordinated by Business Manager Barry Shelley, staff throughout the building are helping with routine processing of applications.

Ganging up to produce the backlog were the the addition of several new DXCC countries, the peak of the solar cycle, and new band endorsements for Amateur Radio's most popular award. For more background read "It Seems to Us," in November *QST*.

[] At The Front: The New Bern (NC) Amateur Radio Club will sponsor a Novice licensing class using ARRL materials. Not news? The news is the class will be conducted in Saudi Arabia, under the direction of U.S. Marine Mark Bitterlich, WA3JPY. Bitterlich, 37, has asked the club to send the study materials "to relieve the boredom and inactivity of those serving in 'the sand pile.'" The club's next step is to get accreditation for a volunteer examiner team.

[] The Queen Mary is back on the air. After a year of inactivity the ship's Amateur Radio station--W6RO, the club call sign of the Associated Radio Amateurs of Long Beach--once again provides a look at the hobby to visitors (as well as an opportunity to operate for visiting hams). Nate Brightman, K6OSC, is radio room manager.

[] The Radio Amateur Satellite Corporation has honored two HQ staff members. At their Oct. 20 banquet AMSAT recognized laboratory

supervisor Jon Bloom, KE3Z, and educational activities coordinator Rosalie White, WA1STO, with plaques for their work with SAREX. Bloom was the original HQ liaison for the SAREX working group; White has been a member of the group since early 1989. Some 25 AMSAT volunteers also received plaques.

[] Richard A. Burton, formerly WB6JAC, has been fined $2,000 and placed on probation for 12 months, for transmitting without a license through a Los Angeles 2-meter repeater. Burton was convicted of the charge July 20 in federal court. In the early 1980s Burton's license was revoked for Part 97 violations. After his appeals were turned down he was ordered off the air, but he continued to operate. Following appeals Burton was jailed for seven months and then served five years on probation.

[] Nominations are solicited for the 1990 ARRL Herb S. Brier Instructor of the Year awards and should be sent to your Section Manager by January 31, 1991. These awards, recognizing classroom instruction in Amateur radio by both professionals and volunteers, went (in 1989) to Lyle Aufranc, AA6DJ, and Gerald Kasselmann, KD4QA.

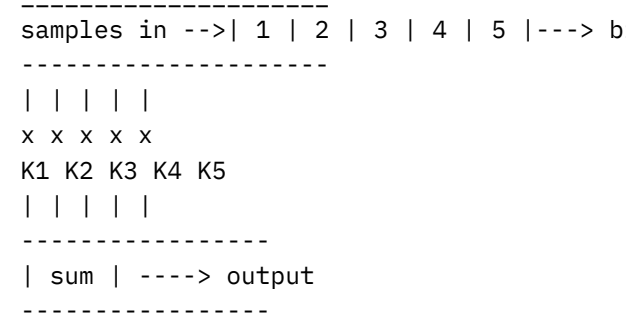
Brian Kantor gives a good nutshell intro to DSP. The method he describes for filtering is only one of perhaps three different ways of doing it in DSP; I think it's called "transform filtering".

Two other ways that are actually much more used in practice are called "Infinite Impulse Response" (IIR) and "Finite Impulse Response" (FIR). The names come from the fact that you can send an impulse (a "spike") into an IIR filter and have the effects reverberate in the output forever, while an FIR filter will always settle down if you wait long enough.

The difference is that IIR filters have internal feedback, while FIR filters do not. IIR filters consist of stages of registers and multiply/add operations that often closely resemble in structure what you would build in analog hardware. Performance is very similar too, except that you don't have the component tolerance problems you usually have with analog filters.

An FIR filter consists of a long shift register that is clocked at the "sample rate" (the rate at which you feed new input signal voltage measurements into the system). (Actually, since each sample is typically 8 or 16 bits, you need 8 or 16 shift registers in parallel, one for each bit of the sample.) A sampling clock pulse causes the value in each register stage to move down one stage toward the end; when a sample "drops off" the end it is discarded. After each clock pulse, all of the register stages are read out in parallel. Each value is multiplied by a constant unique to that stage, and the results of these multiplies are all added together. This becomes the filter output for this clock pulse. When the clock ticks, a new sample goes in the front, the oldest sample is clocked out into the bit bucket, and the multiply/sum operations are done all over again.

Here's what an FIR filter of length 5 would look like. If the samples are 8 bits wide, then each stage of the shift register has to hold one 8-bit sample in parallel.



You can see why this is called a "finite impulse response" filter. No matter what constants you use, the effect of any input signal will not continue past the point where it "drops off" the end of the shift register. But by choosing an appropriate constant for each stage in the chain, you can make an impulse at the input produce any waveform you want at the output, as long as the chain of registers is long enough.

Being able to produce an arbitrarily-shaped response to an impulse input is equivalent to being able to produce any filter shape (in frequency) that you want; again, you are limited only by the length of the shift register. In a long register, you have a LOT of "tweaks" to play with, so you can produce some pretty bizarre filters if you like.

Filter lengths of 256 stages are common in real systems. Programs exist that will determine all those constants for you. You tell them the (arbitrary) frequency response curve you want, along with various constraints on the system (e.g., the maximum length of the shift register, the desired tolerance in meeting your response function, etc). Out comes a list of constants plus a plot of what the actual response will look like. (The longer the shift register, the closer this will be to your desired response. Some filters, e.g., perfect lowpass, cannot be realized without an infinite number of stages. This is not a limitation of DSP - you can't build a perfect analog lowpass filter without an infinite number of components either.)

The most useful FIR filters have symmetrical constants; in my example, K1 = K5 and K2 = K4. This produces filters with flat "group delay" (aka "linear phase"). That means that all frequency components in the input will pass through the filter with the same time delay (if they make it through at all, that is). This feature is an extremely useful one in modems, but it is VERY hard to provide economically in either analog hardware or IIR DSP. This is perhaps the main reason why FIR filters are so popular, despite their needing many more shift register stages and arithmetic operations than IIR filters with the same frequency response curves.

Now that you understand how a FIR filter operates you can see why regular CPUs are usually inadequate to build serious filters, and why the "multiply/accumulate" instruction in a DSP chip is always so heavily optimized: the FIR structure is simple, but computationally very demanding.

The multiply/accumulate instruction takes two values from memory, multiplies them together, and adds the result to the accumulator. Many chips do it in one or two CPU clock cycles. (The shift register is usually implemented in memory. Instead of actually copying the data on each clock pulse, you create a circular buffer and just increment some registers to keep track of where the beginning and end are.)

As these chips get faster, you can build longer FIR filters (or run shorter filters at higher sample rates) and do more complex systems on a single chip. It is now no big deal to do a complete 9600 bps phone

modem, with multiple FIR filters, phase locked loops, data descramblers, etc, all implemented as sections of one big program that a single DSP chip completely executes once per sample.

|> compared with having to learn English in order to do phone DXing?

Derek,

How does knowing CW help me converse with people who don't speak
English, assuming, of course, that I can't speak *their* native
language either?

English is a natural language. CW (or more precisely, the
International Morse Code) is a *CHARACTER SET*, nothing more. Knowing
a character set does not mean you know the natural language that uses
it, as anyone who has studied Russian (or Japanese) can tell you.

Oh, you're referring to "conversations" like "FB OM UR 599 HR CUL 73 QRZ..."?
Never mind...

Dana,

You're quite right - in theory it shouldn't matter which sideband you use for packet. In practice, however, sometimes it can make a difference because of the non-symmetric response (amplitude or phase) of the crystal filter in your radio. In this case, one sideband or the other may give better results. N4HY and I have both noticed that LSB works better than USB when receiving PSK from the Microsats on our IC-471s.

>propagandized with the idea that tradition is bad? Progress has been, and will
>continue to be, made while holding to traditions.

Things were different back then. When ham radio first got started, there
was no tradition to look back to, so the issue just never came up. Code
was the only way to operate, and if you didn't learn it, there just wasn't
anything to do. It was required for a license simply because you just had
to learn it anyway.

But things change. If people themselves want to live in the past, let them.
But let ham radio go free to find its niche in the future. Don't tie it
down to the past.

>Why do I keep spinning the dials up to the VHF and UHF bands and hear people
>who make me feel bad instead of feeling profoundly proud? There are bad
>attitudes and rotten apples all over, that's why; and I certainly can't see
>a no-code license improving THAT.

I'm not saying it will. But a code test hasn't improved it. It's bad now.
The question is if a code test is preventing it from getting worse. This is
something we cannot know the answer to (many of us believe something).

These problems are the result of society and government. People have so
little respect for government these days. It's rather obvious when the FCC
cannot afford to enforce existing laws. And now we have this crazy drug war
that is doomed to failure. Government has no respect any more.

>The point is, that none of the foregoing hyperbole is selling no-code, (or, for
>that matter, pro-code) and few people seriously believe that no-code is the
>panacea that will rescue amateur radio from (moot) death.

No, "no code" won't save ham radio. Marketing the hobby will, but we can't
do that until we are out from under the code requirement that is stiffling
the product.

You can't sell a product people won't buy.
Once you have the product, then you have to SELL SELL SELL!

3064. Spanish Time Stations ???

Newsgroup: rec.ham-radio
Date: 1990-11-13 07:10:45 UTC
From: w1gsl@athena.mit.edu
Message-ID: <1990Nov13.071045.21754@athena.mit.edu>
Source record: 6674
Cross-posted to: rec.ham-radio,rec.radio.shortwave

On a recent trip to Florida I noticed an interesting time signal
at several spots across the broadcast band.

It had ticks at one second intervals and a tone at the exact minite,
followed by a high pitched RR in code about 2 seconds later.

All through this in Spanish a man and woman rambel on.

The signals were quite strong with the minuite beep sometimes copyable
over the Miami 740kHz news station even in Miami Beach. The other two
chanells were around 590 KHz and 950 kHz (?? I seem to have lost my notes)
The voice program seemed identical between all 3.

Any one know who runs this service?

What the format is ? ie how is the time actually stated (ascii on the RR?)
What the commintators were rambeling about (mabey advertising?)

I probably should have had someone who spoke Spanish listen while I was down there
but didn't get a chance, and I do not seem to be able to copy it up here.

3065. Marine Band radio Frequencies?

Newsgroup: rec.ham-radio
Date: 1990-11-13 07:41:36 UTC
From: w1gsl@athena.mit.edu
Message-ID: <1990Nov13.074136.22295@athena.mit.edu>
Source record: 6675
Cross-posted to: rec.ham-radio,rec.radio.shortwave

My question is about the odd order that channel numbers are displayed
on the 2 digit LED display.

The following are sequencially displayed as the selector knob is rotated;

1 2 3 9 --- transmitter will not key on these

o6 o7 o8 o9 10 11 12 13 14 16 18 22 24 25 26 27 28

68 69 70 71 72 78 79 84 88

The rig makes about 15 W into a dummy load on all chanels except
13 where it seems stuck at 1 W.

Any thoughts on the odd channel number spacing ?
Why ch 1 2 3 and 9 are RX only ?
Is the display operating properly?

In a few min of tunning (at 2AM :-)) I was only able to hear one
conversation on ch 18, then again there was almost no antenna !

I remember having seen several stations called "Radio Reloy" when reading through the WRTH, all located in the Caribbean (dunno exactly where, maybe Cuba, maybe there are several countries using the same name and/or format for their news program).
They are described as news and talk stations, with second ticks and a signal, identification "Radio Reloy" and time announcement on every minute.

Can't tell you more from my memory, but this should be something.

3067. Re: RF attenuation through PVC

Newsgroup: rec.ham-radio
Date: 1990-11-13 11:40:12 UTC
From: dstock@hpqmole.sqf.hp.com
Message-ID: <410005@hpqmole.sqf.hp.com>
Source record: 6577

I think that the PVC drain pipe available in the US is similar to that in the UK and is actually referred to as UPVC - meaning unplasticised PVC.

In the best tradition of jargon generation unplasticised does not mean that plasticiser has been removed, but that none was ever added in the first place !

This is reckoned to increase the PVC's resistance to UV

Quite a large number of local homes have been fitted with UPVC window frames, which have to meet UK regs for life expectancy and environmental exposure. Although we are justly famous for our minimal UV levels, these people are gambling around $15000. Perhaps an antenna sleeve in a sunnier clime is a comparable risk :-)

The better quality 1/2 inch co-ax cable (UR67) has a non-plasticised outer and is reckoned to have longer life out doors. It is noticably les flexible than the inferior stuff. Opaque black pigmentation is used to decrease sunlight penetration thus also increasing life expectancy.

carbon has sometimes been used as the pigment- should make a nice RF screen ....

Just have her pick up a VHS camcorder and then an 8mm camcorder. Regardless of technical merit, 8mm is a big plus in weight. In addition, the 8mm cameras all seem to use those little tiny batteries available at Radio Shack for $30, not the mucho-bucks of the big camcorder batteries.

You can get super VHS, or super-Beta camcorders, but 8mm gives as good a picture as your likely to see with home recording, and the sound is not linear on the tape. I bought a cheap 8mm and they do cost a lot more than most VHS stuff, but just have her TRY one, and you won't want anything else.

There have been various discussions on small HF radios; nobody has mentioned the Mizuho 'MX' series; Only 2 watts o/p, but SSB (and CW for the diehards) available on 80, 40 and 20 meters (different radios for different bands!). Use VXO control (so you only get 25 or 50KHz per xtal). Has IRT, noiseblanker, s-meter etc. Lovely and small! (66 millimeters by 39 millimeters by 142 mm) Runs off nicads or external supply.
The radios cost 189 pounds sterling each, but thats after all the execrable taxes thrust upon us Britishers by the Government and the European Community bureaucracy;- Statesiders or anyone going to Japan should get significant discounts, we just pay through the nose :-((
I wonder how far 2 watts will go on these bands - could we be seeing the emergence of the 'HF Handie-talkie' ???

What you heard was Cuba's "Radio Reloj," literally translated
as "Radio Watch." It's a nationwide network, heard on multiple
MW freqs across Cuba. The Spanish speech over the time signals is
news broadcasting. If it helps, imagine WWV with news superimposed
on it :)

Radio Reloj seems to be a fairly common format in the Caribbean; a
quick flip through WRTH shows stations in several countries, including
Puerto Rico and the Dominican Republic, with similar formats.
Cuba's is especially noticeable because it's on so many high
powered MWs. The 570 kHz freq is supposed to be particularly
strong. Hope that helps.

DISCLAIMER: I don't even speak Spanish. Why should you
trust _me_?

Picking a camcorder isn't as easy as choosing the lightest unit. There are many tradeoffs and due to the significance of the investment it is worthwhile to do some investigation. The 8mm units are small and light but overpriced due to the manufacturer's monopoly on the format. Their tapes cannot be played back in the home vcr. They use nicad batteries that have very limited capacity, easily develop memory, and self-discharge rapidly (which means that when you pick up the camera after not using it for a month the batteries are half-dead and will expire just as junior blows out the candles). The cameras are small and due to their design the weight must be borne completely by the hand rather than resting on the shoulder as the larger units do. They tend to bob around alot when handheld because of the way they are held. The resulting movies are hard to watch. The larger VHS units are easier to hold steady, especially for long periods. They cost much less than 8mm for the same features. VHS Tape is much cheaper and plays directly in the home vcr. The batteries are gelled lead-acid and don't develop memory or self-discharge quickly. They are much cheaper (for a given capacity). One inexpensive GE VHS camcorder I looked at recently would run for 3+ hours on one battery. The 8mm units generally poop out in way under an hour. The VHS batteries are generally available for around $40. The large capacity batteries the 8mm units need to run even one hour cost closer to $100 and stick way out the back of the camera and make it much heavier than it was with the stock battery.

Still, the 8mm may be the best for her -- but some thorough investigations are warranted.

I'm curious where on the license it says this. Mine doesn't say anything like this. I got my first license in 1986 and it didn't say anything then so I guess they changed it sometime between when yours and mine were issued.
--

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
<phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

My current license (which I obtained in 1984 at the Seattle FCC office) required that I pass a 20 w.p.m. code test. Therefore the implication of holding the license is that I have passed the test and thus should know the code.

If you hold a X class license - it should be fair to assume that (at one time) you knew the code well enough to pass the test to acquire that license. The only alternative is that you cheated.

I know of some cases where folks holding a "conditional" class license were required to show up for re-examination. This license was the same as the current general class - only it was given by a single volunteer examiner. Needless to say, folks cheated. (i.e. Bring over a bottle of booze and we'll take your test.)

Back in the early 70's it was a renewal requirement that you sign a statement saying you had spent some trivial amount of time operating and that you still knew the code.

3088. REVISED: engineering drawing--TOWER

Newsgroup: rec.ham-radio
Date: 1990-11-13 19:48:21 UTC
From: macmillan@iccgcc.decnet.ab.com
Message-ID: <1967.274007b5@iccgcc.decnet.ab.com>
Source record: 6598

ENGINEERING ASSISTANCE NEEDED:

I am trying to get an engineering drawing for a telescoping tubular
tower manufactured by the now defunct Wilson Systems Inc.
formerly of LasVegas Nevada.

I understand that this was sold to "TRISTAO"something....
but info on them is scarce.

Any ideas? The city is giving me lots of grief on stamped drawings
(in addition to other things) and a drawing would be alot easier than
sawing off a sample of each tube and paying for metallurgical studies.

TNX de WA8ZHN / PRBWON: still fighting.

>Karl, save yourself some $$$, and forget about the extra 15 watts. It
>will raise your transmitted signal less than one S unit. 10*log10(40/25)
>ain't much.

There was an article in 73 magazine describing how to replace the 2510
finals and get the output up in the 60..70 watt area. That's
10*log10(70/25) = 4.5 db. Still less that 1 S unit (6 db) but a noticeable
improvement.

Personally - my 2510 works just fine at 25 watts. No need to mess with
it. I worked two new states in the big pizza contest and Sweden before
work this morning. My biggest complaint with it is the lack of a low power
button like the Radio Shack version has.

>
>I've used 400 watts (vs 100) on 10 meters. Presumably, it should
>account for 6 dB more signal, but it's a waste on 10 meters. 10 meter

When I designed the channel selector circuit in the Drake MRT-55 way back when, I remember that the channel numbers were not sequential (in frequency), and I seem to recall some of the channels were receive only. My memory if foggy on this, tho. (It has been 15 years.)

I like the feel, but never noticed the sound problem until I tried to use one in a voice ham radio contest. Every time I typed a key, it would trip off the VOX (voice-operated relay) and I'd miss part of what I was trying to copy down. Fortunately, I found a quieter keyboard to use for the European runs the next morning.

MOTOROLA AMATEUR RADIO CLUB JACKET ORDERING TIME IS NOW AT HAND...

The jacket will be (like last years model only newer..) the windbreaker
style, royal blue in color with lining and white lettering printed
on the back (with the
Motorola ARC logo) and your name and callsign Stitched in white thread
on the front. The call sign will be in block letters and the name is
in script font. The price below includes everything..tax, printing,stitching
and delivery. The Deadline to order is 14 December 1990.

Sizes and cost...
S,M,L,XL (these are normal sizes) $29.03
XXL $32.74
3XL $36.03
4XL $40.03

Checks only, made out to the Motorola Amateur Radio Club

Contact Steve Sagerian @ 2-4614

Limited offer, void where prohibited, operators are standing by..

3104. Homebrew UHF SWR meter

Newsgroup: rec.ham-radio
Date: 1990-11-14 00:00:12 UTC
From: pault@mlacus.oz
Message-ID: <680@mlacus.oz>
Source record: 6614

Dear fellow homebrewers,

I want to build a simple SWR meter which still works at VHF and UHF.
Specifically, I want it to set up a 70cm antenna. I don't need absolute
accuracy, simple relative F/B comparisons are all I need to resonate the d.e.

It should be easy to reproduce (eg. stripline on PCB), and it must not use
any of those isolationist US components which do not exist anywhere
else in the world (ie. there must be NO references to an inductor with a
footnote which says "available from USA-Q Inductors, 1119888 USA Rd. USAtown).

Can someone give me a reference to a construction article in a technical
magazine (eg. HR, QST, Handbooks)?

Any help leading to a successfully procured article will be greatly appreciated
and will add another satellite user from VK to the bird!

>>bandwidth. If they turn into real technology mills, then expand them.
>
>My argument against this is that small subbands won't produce any usable
>results due to:
>
>1. Subbands might be too small.

NIMBY is just what I had in mind. Define some proportionately-sized
subbands. I don't want all of >30 MHz turned over to to these new
licenses until they can prove they can behave themselves. I used to be
a CBer, good buddy, and NIMBY essential for me to support a codeless
license that (presumably) will attract the masses.

>2. Semi-ghetto effect due to lack of contact with hams on the "main"
> subbands.
>3. Duplication within these subbands of band planning done elsewhere
> and resultant planning/ccordination problems.

This is provably false. Look at the current incentive-induced Novice
ghettos, and tell me that you still belive this. Gentlemen's agreements
for DX, ATV, packet, et.al. grow from the allocation. That will be
the first test - can the NoCoders be Gentlemen ?

>>Two guys here knew they
>>were being hazed, but then got into the challenge so much, they went for
>>13 WPM !
>
>And what if they had NOT been hazed? Might they be going for 20 or even 35?

Well, I'm one of them, and I'm at 20 seconds of solid copy at 18 WPM. I
see it as a challenge, and much more real-world than watching TV,
playing computer games, working DX, or any of the other Great American
TimeSinks.

>>For anyone who plays Tetris, or any of those video games, Morse Code is
>>like making it to Level 5, 13, or 20. I've watched my wife spend hours
>>trying to hit level 10 / height 6. No difference. She could have been
>>at 13 WPM by now.
>
>OK, so when do we see the "Morse Code Game"?

It's currently playing on cassette players across the country. Sigh, no
blinkenlights or whizzengrafics.

Attitude, my friend, it's all in the attitude. It is a game if _you_ define it to be (just like life, but I wax philosophical). The problem is that Morse is an audio training exercise, and any video is a distraction. Pretty low tech, I'm afraid.

>>Agreed. But the purpose of ham radio is not efficient communications.
>>(Boy, am I going to get flamed for that.) The purpose is to _develop_
>>and _test_ efficient communications (like packet, new modulation
>>techniques, etc).
>
>One of them, anyway.

Right. We occasionally do public service and other stuff.

>>Then we need to create a VHF-and-up license class. But, if that happens,
>>I want large Communicator-free subbands. If the usage patterns explode
>>like everyone predicts, then give them more spectrum. If they behave
>>like cretins, take away some spectrum.
>
>How large? Where do you divide the spectrum? Specific ideas?

Hey, I don't know ! If I did, I'd have some specific suggestions. My off-the-cuff impulse is to make Communicator a sub-band within the Novice subband on >30 MHz. If the subband doesn't exist, create one like that found on HF. I'd suggest an initial allocation of 10-20% of the (sub)band. I think we have enough on 1200 MHz and up to allocate a couple ATV channels.

-
- Should we continue to issue Extra Class licenses in the current
- manner ?
-
- Should we not reserve this class for those who can really
- demonstrate the capabilities beyond the norm that we see
- today and have done so maybe for the last 10 or 20 years.

I've only been a licensed ham for about one year now, but I've been interested in the hobby and have listened in for about 10 years. After hearing some of the absolutely moronic and obnoxious things done by extras (not to mention watching one blow out the finals of a radio 'cause "He was an extra and knows how to tune a radio") I'd have to agree with you. I'd like to see a license class or endorsement the translated into real respect for _proving_ that you possess the _spirit_ of amateur radio, not just the ability to memorize a multiple-guess question pool.

Subject: Re: ARF ENDS BOYCOTT

>ARF is Schmidling's "Amateur Radio Forum". I read
rec.ham-radio and it seems that he uses the 40 meter (7 MHz)
ham band to preach his political gospel, which is
probabilistic given FCC restrictions on the content of
amateur transmissions.

ARF says:

Interesting word, probabilistic. If you are questioning the
legality of ARF, give up. The Forum is not only well within
the legal constraints of amateur radio, it is very popular
and probably the only worthwhile and constructive use
currently being made of the amateur frequency allocations.

> The ham who commented about it in rec.ham-radio found it a
dubious and annoying use of bandwidth and that it was pretty
much only Jack doing his thing and didn't involve other
hams.

ARF says:

I hate to burst your bubble, but I stopped keeping records
when the "roll call" reached 1000. That's 1000 different
hams actually participating in the discussions, not to
mention those that just listen, in addition to tens of
thousands of shortwave listeners. I receive cards and
letters from listeners all over the world.

In addition to our own discussions, I frequently interview
guests and field questions and comments for them. Among the
notable guests:

Jerry Levin former hostage, CNN bureau chief
Rob Sherman American Atheists
Paul Findley former congressman
Wayne Heimbach Amnesty International
Rashid Khalide Prof U of Chi
Jay Miller ACLU
Dr Ron Pine taxonomist, Field Museum
Dr Louise Cainkar Pal Human Rights Info Center
Mark Bruzonski Jewish Committee on Mideast
Abdul Wali Mohammad Nation of Islam

It is typical strategy of your type to belittle what you can
not deal with in any other way but for the benefit of those
who really care, the schedule for ARF is:

Thursday at 9:PM Local time in Chicago.

The frequency is 3.950 MHZ, LSB.

Unfortunately, you must have a short wave receiver capable
of single sideband reception.

.....

If you have had it with the "best congress money can buy",
e-mail to arf and I will send you info on how to do
something about it. DO IT NOW!

****

If you have received the info, email to arf for the
current..... ARF ALERT. Specify "Alert Only"

ARFNET: A Network of concerned Americans utilizing
computer and ham radio communication links.

3111. Packet DX

Newsgroup: rec.ham-radio
Date: 1990-11-14 12:16:32 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9011141324.AA07007@ucsd.edu>
Source record: 6621

In a recent posting, Phil Howard asked about a separate VHF
sub-band or channel for packet DX. Astonishingly, I agree with
Phil. Packet DX can be a load of fun. During an Es opening
a couple of years ago, my packet logger overflowed with W5s
in about 5 minutes - quite a bit faster than I would have
been able to work them manually. Luckily, I live in an
area where loacl packet activity was low at that time, otherwise
no DX could have overcome local QRM.

A separate packet band, well removed from the weak-signal areas of
the VHF bands, would be ideal. Perhaps the region just above the
beacon bands on 144 MHz and up? You'd only need about 25 KHz, I think.

The trick, of course, will be in keeping these channels free of local
traffic. We've been fighting that battle on the SSB calling frequencies
and the 6-meter DX window for a long time...

3112. Updated Macintosh Ham Stacks (for HyperCard) now available

Newsgroup: rec.ham-radio
Date: 1990-11-14 12:52:41 UTC
From: dls@genrad.com
Message-ID: <39651@genrad.UUCP>
Source record: 6622

This is just to let you know that I've finally updated the Ham Stacks to the latest question pools. It has been a long hard battle, since I have been unable to GET the latest question pools until just recently. My thanks to Stan and Peter and ARRL and W5YI (and others) who helped point me in the right direction.

Anyway, here's the scoop. I've created 5 Hypercard stacks which allow you to test yourselves realistically for that upcoming license upgrade. Each of the stacks has the entire question pool in it and it will automatically generate a pseudo-random test of the correct length (for example, 30 for the Novice) AND the right subdivision question mix at the beginning of each test. Each will automatically score you (and even clap hands if you get 90 or above) at the end of each test and will tell you which questions you missed and give you the option of reviewing these missed questions.

There are other features as well. You can print a "test" to be given to others. It even prints the question key. Be aware, though, printing a "test" takes a LONG time, but it does work. You can also print just the score sheet (along with the question key) if you wish to keep track of how you're progressing. You can set the test to provide automatic feedback of question correctness, or to only tell you which you missed at the end of the test. This makes it QUITE nice for using the Novice test to ACTUALLY test prospective Novices and it IS legal (I have spoken with some VE's about this). There are some extra, slightly manual, hooks that I've placed into the Novice test, to facilitate giving these tests to Novices (these hooks are NOT documented, since I'm still playing with them).

These stacks are only available for Macintosh computers, so please don't ask me if you can use them on an IBM.....you can't. These stacks also require that you already have HyperCard which is a software tool which is shipped with Macintoshes nowadays. I will not send you HyperCard; if you don't have it, speak to your local Macintosh dealer. Note that HyperCard requires at least 1Megabyte RAM and PREFERABLY a hard disk drive.

The latest version of stacks are as follows:
Novice Ham Stack v3.0
Technician Ham Stack v3.0
General Ham Stack v2.0
Advanced Ham Stack v2.0
Extra Ham Stack v2.0

These may be obtained directly from me by sending a SASE (self-addressed stamped envelope) and 800K diskette (be sure the SASE is suitable for the diskette). The stacks are shipped in a compressed format, but the decompresser is also provided on the diskette. In unpacking them (onto another diskette or hard drive), my only recommendation is : BE PATIENT. The unpacker is SLOW and doesn't provide any feedback that it's doing anything for about 2 minutes, but it does work.

Evenutally, these stacks will be available via anonymous ftp thru Patty Winter (winter@apple.com) or her associates. I do NOT have the ability to send these via email or anonymous ftp, so don't ask. Other bulletin boards may also have these available (for example, the one in New Hampshire thru WD1V), and I have no objection to anyone making them available to other people. This software is PUBLIC DOMAIN and may not be sold by ANYONE except me, and I'm not selling it.

3113. Silent Key worthy of note

Newsgroup: rec.ham-radio
Date: 1990-11-14 13:52:27 UTC
From: mrb1@cbnewsh.att.com
Message-ID: <1990Nov14.135227.12627@cbnewsh.att.com>
Source record: 6623

Excerpted from "Broadcasting" magazine of 11/12/90 (without permission):

Floyd N. Lantzer, 84, engineer, died of kidney and heart failure October 27 at Bethesda North Hospital in Cincinnati. Joining WSAI(AM) Cincinnati in late 1920's as engineer, Lantzer later joined Crosley Radio Co.'s co-owned WLW(AM) in Mason, Ohio.

Credited as engineer who gave WLW around-the-world reception with 500,000 watts in 1934-38, Lantzer retired in 1968 after 40 years with station.

Lantzer was also amateur radio operator for 60 years.

There are few radio enthusiasts who have not heard WLW, even at its present 50,000 watt power level. The stories about the 500,000 watt operations are legendary, and Mr. Lantzer must have been quite a person.

Just thought that his passing should not go unmentioned. Perhaps some other rec.ham-radio readers knew him personally, and could share some details of his work. As a former broadcast engineer, I'd sure be interested.

Try page 11.9 of the RSGB's excellent book "VHF/UHF handbook" (probably
available from the WIA (or even Dick Smith)).
There is a description of a precision-type reflectometer and a general
purpose directional coupler.

>
>It should be easy to reproduce (eg. stripline on PCB), and it must not use
>any of those isolationist US components which do not exist anywhere
>else in the world (ie. there must be NO references to an inductor with a
>footnote which says "available from USA-Q Inductors, 1119888 USA Rd. USAtown).
>

Over here in the good old us of a directional couplers are almost always
to be had at ham-fests (of which there are many over the summer), but
alas in Oz there are very few (and very little gear available)

3118. ICOM receivers: R9000 or R71A and R7000

Newsgroup: rec.ham-radio
Date: 1990-11-14 16:24:40 UTC
From: jl@newt.sbi.com
Message-ID: <378@chi.newt.sbi.com>
Source record: 6478

I would appreciate receiving e-mail discussing the following
question. I will post the results if they are of general
interest.

I am looking for the ultimate quality in a general coverage
receiving system (i.e. .1Mhz to 200Mhz or better) capable of
receiving all modes in use (AM/FM/USB/LSB/CW/RTTY/FAX/etc.).
I need very good sensitivity and selectivity to
DX distant weak signals. Assume that I will have access to an antenna
farm. I will interface to a PC. The question is:
Do I buy the ICOM R71A (.1Mhz to 30Mhz) and the R7000
(25Mhz to 2000Mhz) cost ~$1600
or do I buy a second hand ICOM R9000 (AUG 89) (.1Mhz to 2000Mhz)
with a CRIS 6000 for $4,200
Obviously there is a difference in price, but the R9000
has also plenty of good stuff (i.e. spectrum analyser)

I anyone using an R9000 ? What is your impression ?
I anyone using an R7000 ? What is your impression ?
I anyone using an R71A ? What is your impression ?

Again, I am looking for very good selectivity and
sensitivity.

May be someone will suggest a different setup
(Yaesu, Kenwood, etc.)
Someone suggested the AOR 3000 scanner but I am ruling
it out because of its poor signal separation and the
lower quality of its SW portion.

Tahnks for the replies

From: anderson@skvax1.csc.ti.com
Message-ID: <9011141632.AA22834@tilde>
Source record: 6479

Is there a list maintained anywhere that shows what PBBS address a particular amateur uses as his main PBBS.

This type of information would be good in the callbook, but I don't recall seeing it there.

I have been compiling a list of calls I see here, that have PBBS addresses associated with them. Has anyone else done a similar thing and have it online somewhere or is interested in such.

Don't forget the moonbouncers, they still need the power for that path unless
they use truely monsterous antenna arrays and/or lots of DSP. And when they
have the monster arrays and lots of DSP the truly wacko will want to try
Mars bounce. :-)

Even at HF in the late summer when atmospheric noise is at maximum, extra
power is sometimes needed on 160 and 80 to make the circuit work. Power
is not evil, misuse of power is evil.

A comment by someone who uses cameras professionally. In broadcast news gathering, we find that the home cameras are too small and light to be used properly. The major thing that differentiates the amateur and the professional TV photographer is the steadiness and smoothness of the professional's pictures. The very small, very light home cameras are nearly impossible to operate steadily and smoothly. Our people prefer a camera that weighs at least 15 pounds and is balanced to be carried on the shoulder. Some of the latest professional cameras are considered to be too light by many of our people and you will see extra batteries taped to their cameras to regain the mass needed for steady work. So beware the tiny cameras, the shaky results may disapoint you. The picture quality is pretty good though.

>
> Then again, I've never used HF packet :-)

It only matters as a convention for meeting a station on a specific
frequency. If you agree to meet a station on 14.103 and he's using
LSB and you use USB the two of you will be transmitting about 3khz
apart and will not link up. If you understand this problem and adjust
your frequency to allow for it all is well. But if both of you understand
the problem, and both of you compensate for it, you're back to being
3khz apart again. Specifying a convention helps prevent this confusion.

I wish there was some way the Mac-based ham community could truly reward
Diana for these stacks. I used her earlier sets to go from nothing to Extra
in just over a year. Of course, I read the books, but the ability to have hypercard test me over and over again helped me realize where I needed more studying (and helped me with the famous exam nerves syndrome.)

So, Diana, for all of us: Thanks so much!!!

>And your chance to use lots of HF spectrum to meet many new friends around the
>world has also slipped away.

Ah, here's the rub, if you want to use the HF CW spectrum you gotta know
Morse. It doesn't matter whether you were required to pass a test or not,
if you don't really know Morse you can't use Morse. If you don't want to use
CW, it doesn't matter whether you passed a test on Morse or not. Of course to
get a license you must pass a Morse test, but that's irrelevant to actually
operating Morse. You know even a dyslexic, tone deaf person like me passed
a 13wpm test after months of generally wasted effort, but I still don't do
Morse well enough to enjoy operating HF CW. This certainly makes the Morse
exam seem irrelevent to me.

Howdy all!
This year on November 29, The Texas A&M Amateur Radio Club will be running
a special events station. We call it CQ Bonfire.
We will be operating mostly on 10 and 15 meters under the club call
W5AC from about 11am cst to 6pm cst. Contacts locally may be made on
the 146.82 repeater pl 88.5 or dtmf 21.
These are the most likely bands for operation but we will be happy to sked
on any of the following other bands.
80m
40m
20m
15m
10m
6m
2m
70cm

The stacks will be in the /pub/ham-radio directory. I'm not doing the
posting, so I'm not sure exactly when the new ones will be there, but
it should be soon.

I believe that several other FTP sites and BBSs carry the stacks, also.
Perhaps people from those sites could post the details.

In the upstate of SC, they are starting to install an ATV radar link for
the county EOC offices (whose communications are usually handled thru
hams who are members of the CD/EP organization). According to the
plans, it will be kept controlled, with a 2m control link being used (a
DTMF key sequence required to activate the ATV transmission)... I don't
think they are planning to give access to weather spotter groups, but
with the strong support spotters have received from the local NWS WO,
I wouldn't be surprised it that was changed after an initial period.

In article <1133@tsdiag.ccur.com> davet@tsdiag.ccur.com (Dave Tiller N2KAU) writes:
>I've only been a licensed ham for about one year now, but I've been interested
>in the hobby and have listened in for about 10 years. After hearing some of
>the absolutely moronic and obnoxious things done by extras (not to mention
>watching one blow out the finals of a radio 'cause "He was an extra and knows
>how to tune a radio") I'd have to agree with you.

I've noticed that many new hams (and non-hams) seem fixated on the issue
of license class. I realize the following must be obvious, but let me
say it anyhow: "There is no correlation between a person's license class and
their mastery of the radio arts."

Evidently, a number of people consider the matter of license class to be
an esteem issue as well. I consider this an unrealistic way of looking at
things.

When the Amateur Extra class first came out, a few people ran out and took
the test as a geewhiz kind of thing. Then the "higher class license -> more
spectrum" thing came along and a bunch of people upgraded because of the
"incentive." It wasn't really a matter of oneupsmanship.

I got my license after the current scheme was pretty well established
and I upgraded for pretty much this same reason. I was getting frustrated
by my lack of access to certain parts of the spectrum (7.000-7.025 and
3.500-3.525 in my particular case), so I changed that by going to Houston
and taking a test. It wasn't a showoff type thing -- it was a matter of
doing something for myself to get more out of the pursuit (and life in general,
I suppose).

If I had become a VHF/UHF nut from the start, I might have never made it
past Technician Class, because I could do everything I needed to do and
becuase I percieve the geewhiz value of upgrading as very small (compared
to the geewhiz value of wireless communication).

Then the Volunteer Examiner program came along (making amateur radio
more accessable, which is probably a very good thing). I would guess
this provided the impetus for most of the local non-hf people to upgrade
to Extra. Holding any lesser class license would hinder these people
from being completely effective as VEs. Once again, it wasn't a "ha ha
-- I'm smarter than you" exercise.

A lot of these people still don't know much about hf, or DSP, or packet
or whatever. If judgements of individuals must be made, they should be
made on the capabilities of the individuals, not on license class held.

I would like to see people get a little less emotional (defensive?) about
a particular class of license someone holds. There has been a lot of

emotional talk in this group about restructuring the current system and the future of ham radio and so forth. Go ahead and get emotional about these issues. These are *not* the issues I am talking about. I am specifically addressing the mistaken notion that there is a meaningful relationship between the license class someone holds and the amount of skill or knowledge he or she has.

I'm afraid that the FCC doesn't agree with you. I can't comment on the specifics. But I would generally encourage people to call their local FCC field office, as it does make a difference in these sorts of matters.

> and probably the only worthwhile and constructive use
> currently being made of the amateur frequency allocations.

Clearly not true. Although nearly every faction in ham radio thinks that their little niche is the most important, it is the collective that keeps the spectrum open.

> I hate to burst your bubble, but I stopped keeping records
> when the "roll call" reached 1000. That's 1000 different

Not suprising, since ARF is austensibly a broadcast operation. Your claimed figures clearly bely your motives. By your own admission, ARF is 90% broadcasting and 10% ham radio.

You really should look into getting a broadcasting license. If nothing else, you can run all the power you like. If the audience is as big and as devoted as you claim, you should have little problem raising the money for the license and the type-accepted transmitter.

MENSA - Minnesota (1129142)

As I've been reading this (yet another) CW discussion I've been getting
this idea.....

Isn't CW one of the simplest digital modes? What better introduction to
learning communications theory and basic digital communications is there.
Especially since it's one mode that can actually be run using the in-born
bio-computer.

I suggest that the Amateur galaxy could be enhanced in two directions.

1.) Consider CW as a digital mode. It should be taught in comparison with
some of the other simpler modulation methods. Let's start showing how
the bandwidths compare and B.E.R.'s and S/N power requirements.

2.) While CW can be run by a human - there's no reason it has to be. How
fast can a couple PC's communicate using CW on the HF bands? Are there
optimizations to the spacings that improve the performance. What if
CW was sent in packets - complete with ACKs or NAKs? Are there any
BBS's on the air using CW? How about putting Phil's TCP/IP on CW?
You can't ask for a simpler computer-to-radio interface.

3137. packet radio overview

An Amateur Packet Radio Overview

by

Rich Bono (NM1D)

October, 1990
(revision 1.2)

The following is the result of a non-amateur asking some basic questions about amateur packet radio. Several of us thought that this information would be useful to others who are interested in amateur packet operations. Thanks to Tim Dayger for asking the right questions, and to Patty Winter (N6BIS) for her editing skills. I hope that this will be of help to many others. You may reproduce and distribute this as long as my credits remain.

Rich Bono (NM1D)

Our potential amateur packet radio operator asks:
I've used networks, on-line services, and bulletin board systems (BBS) for years, but I've never really paid much attention to amateur packet radio. I'm starting from scratch, and need to have some idea of where to begin.

Just what IS amateur packet radio?

Amateur packet radio is (yet another) digital transmission method available for use via amateur radio. It provides 'error free' transmission and reception of messages (information/data/etc.) between two stations. This error-free capability is a prime consideration. Error free in this context does not mean that your typing or spelling mistakes will be fixed, but that all transmitted 'data' will be received 100% intact, as sent. In fact, if the data cannot be delivered 100% intact, the transmission is eventually aborted and the user is informed that there is no longer a connection between the two stations.

The 'packet' in 'packet radio' comes from the method of transmitting your information over the air. Your data is broken up into packets (or blocks) that are transmitted. Each packet contains the sending and the receiving station call-signs and some optional routing information. A packet can contain from 0 to 256 data (or information) bytes. The users normally do not need to be concerned with this 'packetizing' of their messages. Each packet is sent and then acknowledged by the receiver when received. If a packet is not received correctly, then it is automatically re-transmitted (up to a maximum number of times). You normally don't have to know about all this to use packet radio. The 'packetizing' happens automatically, without any thought or actions required by you.

One of the more popular protocols used for amateur packet radio is known as AX.25. This is somewhat similar to the commercial X.25 standard. There is also a growing TCP/IP user base. If you are not network oriented, then the details of these protocols are not important to you as an operator of a packet radio station.

Be aware that most packet radio operation at this time is at 1200 baud. This will seem slow when compared to what it happening on networks, and on telephone BBSs.... but what is gained is world-wide access, for NO COST. Once you have your equipment, and your license, there are no fees (except for the electricity that your computer and other equipment use). There are a growing number of amateurs who are experimenting with 2400 and even 9600 (or higher) baud operation, so it shouldn't be too long before these faster rates become very popular!

What kind of equipment do I need, and how do I use it with my PC?

Since you own a PC, you already own the most expensive part of an amateur packet radio station. The other piece of equipment that you need is the TNC (terminal node controller). The TNC contains all the software and special hardware that you need. It actually contains the modem (to interface with your radio) and (usually) a microprocessor with the packet software contained in EPROM. You interface your PC (or even a simple dumb ASCII terminal) with the TNC via serial RS-232. Use your favorite terminal emulation software on your PC (the same software that you use with your telephone modem will probably work fine). This is just as easy as connecting your computer to a modem. If you don't want to use the serial port of your computer, there are TNCs available that will plug directly into the bus.

If you don't have a PC (personal computer), then almost any RS-232 ASCII terminal will work with most of todays TNCs.

The most popular packet frequencies in the USA are in the two-meter band (144-148 MHz). Check out the following frequencies (they may be different in your area; ask a local amateur if you don't hear anything). Even the typical 'police scanner' can be used to listen to these frequencies:

145.01, 145.03, 145.05, 145.07, 145.09 MHz

If the above are busy, many areas also use:
144.91, 144.93, 144.95, 144.97, 144.99 MHz

Yes, this is with an average FM transceiver set for SIMPLEX operation (transmitting and receiving on the same frequency).

If there are packet radio transmissions you should hear a sound like:

BBBBbbbbbrrrrraaaaaaappppppp

How much technical or hardware proficiency is required to use a packet radio system?

If you can plug an RS-232 cable into a modem, and wire the TNC to your radio, then you have all the ability that you need. I am sure that there are hams in your area who would be glad to help you if you are not

comfortable with wiring a microphone connector. Most TNCs connect to the microphone plug of an FM transceiver, normally only needing push-to-talk and transmit audio connections, and a connection to the speaker audio output from the FM receiver. This consists of about five wires, and can usually be done without removing the covers of the radio (these are normally external connections).

Installation really is very simple, and once it is done, there is virtually no maintenance. Just plug in your TNC in place of your microphone and external speaker, and you're on the air... to return to voice operation, plug in your microphone. If you like, build a simple switch box to allow easy changing between your TNC and voice operation. I don't recommend it, but some people wire the TNC and microphone in parallel, so that they don't need to change the plugs, or switch anything at all.

What's out there for me to access via packet radio and what potential is there for growth?

This is the interesting part! I believe that packet radio is still in its infancy. It seems like every day a new application for packet radio is announced... some are good ideas... others not. By the time you read this, a lot of the information presented here will probably be out of date; yes this technology is progressing!!!

Here is a *simple* list that barely highlights some of the available uses of amateur packet radio.. I am SURE that I have forgotten something and left it off the list:

EMAIL:
At this time we have world-wide email (electronic mail) distribution. I personally have received email from a few continents, and from all over the USA. Of course, this is limited by the amateur radio rules and regulations, so there cannot be any commercial messages.

Local networks:
Here in New England we have connectivity over most of the region. I can connect to other stations from the following areas consistently: Canada (Montreal), Vermont, New Hampshire, Maine, Connecticut, Massachusetts, Rhode Island and New York. I should note that I am located about 10 miles north of the MA/NH border (in Derry, NH).

Of course, on the HF (high frequency) bands there can be world-wide connectivity, depending on many factors.

PacketCluster-DX spotting:
This is a specialized system that allows a couple of hundred users to be connected to the same system at one time. It is used by those amateur operators who seek contacts with rare stations throughout the world. When any one user 'finds' a rare station on the air, he simply types the information (call-sign, frequency and mode) into his terminal, and within a minute or so, all of the other users are informed of the rare station!!! So-called "DXers" (people who like to hunt these rare stations) LOVE this system. These users can be spread

over a wide area. Our local packet cluster system has connectees
from Maine to New York.

DOSGATE:
A system that allows you to execute programs remotely. A DOSGATE
system may have many programs for you to use over the air. You
don't need to download the programs to use them; you are actually
running programs remotely. DOSGATE allows those who don't have a
computer to run programs via packet radio.

For example, my DOSGATE system has the following programs available
for use by remote packet users:

AUTOEXAM: Take sample amateur exams from Novice to Extra. You can
use AUTOEXAM as a study guide, or to see if you are ready for
a certain license exam.

SeeSats: Real time satellite tracking. Informs you of where the
current OSCAR (and other) satellites are located.

AUTOCALL: On-line amateur radio USA call-sign lookup database.
Simply enter the call-sign of any amateur radio operator in
the USA and it will print out the name, address, license class
and previous call-sign (if any).

GAMES: Several adventure-style games that can be played on-line.

Repeater database: A database of many of the repeaters in the area.

Gateways:
Even though you may not own any HF or UHF equipment (many packet
radio operators only use a simple hand-held VHF transceiver), you can
gain access to other bands and operating modes by using a gateway. A
gateway allows connectivity between two normally non-connectable
communication technologies.

In many areas not only are there major BBSs on the standard two-
meter Technician class frequencies and the 222 MHz Novice class
sub-band, but there are cross-band gateways available as well. A
Novice on the 222 MHz band can connect to a station on the 145 MHz
band by going through a gateway and be able to communicate with
many other amateurs.

Public Service:
Many packet stations are used to help out with sending messages
during disasters. Amateur radio operators help out whenever they
can, and many hams have their packet stations ready for portable
operation to help when needed. There are many training exercises
during each year to help practice and test the readiness of the
emergency stations.

OSCAR Satellites:
OSCAR stands for Orbital Satellites Carrying Amateur Radio. We have
our OWN satellites in orbit that are dedicated for amateur radio use.

There are some satellites that are dedicated to packet radio (sometimes called "PACSATS"). These are for 'store-and-forward' operations to help distribute packet traffic around the world.

Bulletin boards:
These carry postings similar to the stuff on Usenet (or telephone BBSs) and often have archives of useful files (such as local ham license testing sites). These are usually the same packet nodes that transport email.

File transfers:
Better at 56 Kbaud (as some hams are doing), but feasible at 1200 baud. On TCP/IP, you just start it and forget it, so you can do it overnight or at some other time when you don't care whether it takes a while.

Databases:
In some areas there are HAZMAT (hazardous materials), call-sign, and repeater databases accessible via the network.

Station-Station:
I almost forgot.. many people simply enjoy chatting with their neighbors.... This could be with people across the street... or in the next state... or half-way around the world!

I am sure that I have missed something. You asked about potential... as I mentioned at the beginning, we are just getting started!!! Many people are just finding out about packet radio. I believe that the only limitation is our imagination!! We could have a world-wide network (we do currently have a 'slow-speed' world-wide network) in the near future... It just takes a little imagination...

How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?

Well, if you own the PC already... TNCs can be purchased from about $120.00 on up. There are a few for less money, and several that provide for operating on many digital modes in addition to packet radio (i.e., the Kantronix KAM will provide for packet (HF:300 baud/VHF:1200 baud), AMTOR, RTTY, ASCII, NAVTEX, WEFAX, CW (Morse code),...).

If you already own an amateur FM transceiver (or an HF SSB transceiver) then you have all the equipment needed. If not, a two-meter FM transceiver can be purchased for used from $100-250.00, new from $300.00 on up.

Cost effective.... Hmmm, well first be aware that amateur radio cannot be used for any commercial or business purposes... But where else can one get hours (years) of enjoyment and service out of $470.00 ($350 for a radio and $120 for a TNC, assuming you already have the computer or terminal). Note: This stuff can be contagious.... be forewarned!!

What legal issues do I need to consider regarding packet radio? Do I need a license?

Yes, you need a valid amateur radio license. There is (in the southern New Hampshire area) packet radio activity on the Novice bands. But if you want access to the mainstream of packet radio, you will want at least a Technician amateur radio license. (Although, as mentioned earlier, some areas have an active packet radio network that is accessible with the Novice amateur radio license.)

I've tried reading about amateur packet radio, but a lot of it is Greek to me. Please suggest some reading materials such as books and magazines that my campus or local libraries might carry.

There are a few books, etc... but I have found that most assume that you already know about amateur radio. You need to find what we call (ready for another term?) an "Elmer". An "Elmer" is a friendly, helping amateur radio operator who will take you under his/her wing to help and guide you as much as you need. I hope that you can find someone to help you... it takes a special kind of person to be an 'Elmer' (gosh I hate that term).

Good luck with your packet radio activities. If you find this information helpful, I would be glad to hear from you.... How? Simply send me a message via the amateur packet network, NM1D@WB1DSW.NH.USA.NA from anywhere in the world!

>Check out the library! Even the Handbook has some info on DSP.

A good book on the math behind what Brian has described is "Signals and Systems", by Oppenheim and Willsky. Prentice Hall. If you really want your mind bent "Digital Signal Processing", by Oppenheim and Schafer, Prentice Hall, has been the basic text for the past decade. There are newer texts out today and they are coming out faster now that the field is heating up. Be prepared for some heavy math-o-matiks if you get into the theory but as hardware comes on line cookbook solutions for the Amateur will become more available.

>reflect the current reality.

Unfortunately it is reality. But one CAN buy or build equipment to do
all the Morse Code operating if they want.

>"Appropriate skills" sounds like a variation for multiple operating test
>elements to replace the code element. That would drive the VECs buggy,
>and/or make it difficult for a prospective ham to find a VEC that could
>test him on his favorite mode.

It would also increase the paperwork load on the FCC, and push license
processing into the 12-18 month category.

>>It's silly to require people to learn the Morse code in order to just
>>be allowed to talk.

>Tell it to the WARC - they're the ones that require Morse of HF users.

Hey, there is one coming up soon.

>the code.

That only means you once knew it. It says nothing for certain about the
present.

>If you hold a X class license - it should be fair to assume that (at one time)
>you knew the code well enough to pass the test to acquire that license. The
>only alternative is that you cheated.

Yes, at one time.

>I know of some cases where folks holding a "conditional" class license were
>required to show up for re-examination. This license was the same as the
>current general class - only it was given by a single volunteer examiner.
>Needless to say, folks cheated. (i.e. Bring over a bottle of booze and we'll
>take your test.)

These are no longer issued.

>Back in the early 70's it was a renewal requirement that you sign a statement
>saying you had spent some trivial amount of time operating and that you
>still knew the code.

They were wise to remove that requirement. Continuing to know code is no
more relevant to voice and packet modes than is learning it once is.

Well, I'm not convinced that it has no relevance to amateur TV and/or Novice training tapes, but in any event my question has been answered, and I'm grateful to all who offered suggestions.

One does not need to actually know Morse Code to work Morse Code. You just need the appropriate encoding and decoding equipment in such a case. That's not to say manual Morse Code is not enjoyable, its just that there really are other ways to do it.

Someday I'd like to get involved in DSP processing for EME contacts using Morse Code and packet.

Source record: 6558

I've used the US standard white PVC for winding coils & never had any indication of RF burning or melting it. This was the core of a 40-80 dipole. As a matter of fact, the PVC even held up when the antenna took a lightning hit at Field Day!

PVC is also used as the body of several antenna, as well as casings for some radar units.
I doubt if you will find much absorbtion of RF by the white PVC.

BTW, when you get the antenna working, would you mind posting the design on the net? A PVC housed gain antenna could be very useful, especially in apartment/condo installations. I can imagine alot of cases where you could get away with installing a PVC "drain pipe" or "electrical conduit" in no antenna subdivisions. As a matter of fact, something like that may work in the place that I'm about to move into.

The following is a portion of the order from the second order from the

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

WHICH WAS FILED NOV-13-90 / JUDGE FRANK J. BATTISTI

START OF QUOTE:
Defendants make the alarming allegation that the new review " is consistant with and is not a material alteration of previous consideration of PRB-1 by ROCKY RIVER." This statement is followed by a citations to the transcript of the prior review which indicates that PRB-1 and technical data were submitted for consideration. The defendants ought not to think that they will comply with this courts order by going through the motions of denying Mr. MacMillan another permit. Any decision to disregard the federal interests raised in PRB-1 must be based upon substantial justification and explained in the record. Defendants should keep in mind that after this litigation that it may be more difficult to support a claim for qualified immunity if they once again fail to sufficiently consider the federal interests involved.

Plaintiff's motion for section 1988 attorney's fees is GRANTED.

END OF QUOTE: THIS ORDER CONSISTED OF SEVEN PAGES. WILL BE POSTED HERE SOON.

-davet@tsdiag.ccur.com (Dave Tiller N2KAU) writes:
-> I'd like to see a license
->class or endorsement the translated into real respect for _proving_ that you
->possess the _spirit_ of amateur radio, not just the ability to memorize a
->multiple-guess question pool.
-
-It can't be done because it can't be done objectively. What you're left with
-is a clique, a club of good-ol-boys, who are the only ones able to judge who
-is the true "keeper of the flame" for the future. Personalities will get
-involved. Feelings will be hurt and flames fanned.
-
-Do you have something else in mind? :)
-
-Mojo AA4KB

Well I certainly don't intend for it to become a clique. I didn't intend
for it to be given by hams (although I fully support the VE program!). I'd
like to see either the FCC or ARRL sponsor quarterly tests instead of VE's.
I guess what I'd like to see is something similar to the work (but not the $$$)
needed to get a pilot's license. You must show conclusively that you
understand all of the principles involved, and you must also demontrate that
knowledge. They also publish their question pool (I strongly disagree with
this practice), but in addition to their written test, they also must show
their prowess as pilots. It's extremely hard to get a pilot's license without
actually understanding and being able to apply the material, but memorizing
the answers to a question pool for the extra exam is easy without having in-
depth knowledge. I agree, though, that if it can't be objective, it shouldn't
be done. Thank you for your comments.

Well, make that 200 watts for HF and non-moonbounce. But if you're going to make an exception for EME, why stop at ONE KW? Why not 20? One wonders what ingenious work with antennas, DSP, etc., would have been tried and perfected if the KW was not available. Mars? Hmmm, lessee what's the pathloss for that...

In article <39722@ut-emx.uucp> trey@ut-emx.uucp (Trey Garlough) writes:
-In article <1133@tsdiag.ccur.com> davet@tsdiag.ccur.com (Dave Tiller N2KAU) writes:
->I've only been a licensed ham for about one year now, but I've been interested
->in the hobby and have listened in for about 10 years. After hearing some of
->the absolutely moronic and obnoxious things done by extras (not to mention
->watching one blow out the finals of a radio 'cause "He was an extra and knows
->how to tune a radio") I'd have to agree with you.
-
-I've noticed that many new hams (and non-hams) seem fixated on the issue
-of license class. I realize the following must be obvious, but let me
-say it anyhow: "There is no correlation between a person's license class and
-their mastery of the radio arts."

In this, Trey, you are absolutely right. That is why I'd like to see a
way to prove one's "mastery of the radio arts" instead of one's ability
to memorize question pools and decipher beep-beeps. I see many extra
class operators around here who have a very (very!) holier than thou
attitude, and claim that they can't be wrong 'cause they're extras. I may
be a lowly tech, but when I can point to a reference in several books that
show the extras ideas to be faulty and they still stick to 'well obviously
the book is wrong," or, "why that doesn't apply to this situation," it bugs
me. I would like to see a test that would truly separate the people who
actually understand radio and those whose egos think they understand radio.
Thanks for your comments.

3155. Re: ICOM receivers: R9000 or R71A and R7000

Newsgroup: rec.ham-radio
Date: 1990-11-15 15:35:48 UTC
From: dstock@hpqmole.sqf.hp.com
Message-ID: <410006@hpqmole.sqf.hp.com>
Source record: 6565

If you really are serious about that antenna farm, you won't be
using low gain-wide band antennas. May I suggest that you treat
each of your VHF yagis to its own personal band-specific converter.
Switch the converter outputs and your HF antennas into into a good
quality HF receiver. You can add antennas and converters as you
want to extend your coverage. HF gear tends to have much more serious
performance (eg. intermod) and facilities (eg. filters) than is
usually to be found in VHF gear. The top VHF contesters and moonbounce
people still use transverters and HF rigs for these reasons. You probably
may want to use band-specific, switched pre-amps mounted at the antenna.

suppliers:
try MuTek , Microwave modules, Datong etc for amplifiers and converters

The JRC NRD525 and ICOM R71 are generally thought of as about the best
nippon offerings. There were doubts expressed in QST some time ago about
the R71 losing its internal software when its lithium battery runs down.
if you want to go the whole hog, some very good professional receivers
(eg RACAL RA1771/RA1772) are appearing on the surplus market.

If you want fancy memory and scanning facilities, dont compromise your
choice of receiver, use a seperate computer as a controller.

Dont be seduced by toy spectrum analysers, a real one would cost more
than your entire installation. Much of their cost lies in their need
for excellent screening and filters. Opening up the width of roofing filters
to permit a usefilly wide spectrum display compromises a receivers signal
rejection. Lots of whizzo microprocessors and speeping oscillators can
mask small signals with their RFI. Real screening costs big money.

Apologies for a long posting, but I got the impression that you were
more interested in hearing things than in hypnotising visitors with
flashing lights.
All my own opinions, of course.....

have fun GM4ZNX

Howdy netland,
A friend of mine purchased (for $25) a Globe Scout Model 65A transmitter and assorted other bits and pieces of radios. The only documentation he has is a schematic and a tattered copy of an article in the December 1954 issue of Radio and Television News.

Does anyone out there have any info on this rig? Where could I find a reprint of the magazine article?

Does anybody out there know of any program, running on the PC, that implements the AX.25 protocols? Such a program would possibly interface to a little board plugged into the PC bus with a modem on it. Or is the AX.25 protocol too fast and complicated for a mere '286 to deal with? Maybe there's something in one of the ham magazines? I'd appreciate any leads. The complicated part here would be the software, and even though I'm a systems programmer by trade, I really don't have the time to reinvent the wheel... Have any of the ham magazines ever published sample source code for a TNC?

3159. PVC enclosed antennas...

Newsgroup: rec.ham-radio
Date: 1990-11-15 16:56:11 UTC
From: elmquist@nachos.SSESCO.com
Message-ID: <259@nachos.SSESCO.com>
Source record: 6569

I've been reading the traffic about PVC enclosed antennas... and everyone seems to be discussing RF absorbtion by the PVC.. isn't there also a velocity factor of the PVC to be considered? I've built several "twin-lead j-poles" and tuned them up outside the 3/4" PVC pipe... when they are slid inside the pipe, they completely detune. There is a definite shortening affect (ie, make the antenna shorter) when putting it inside PVC...

A while back I asked the net for the velocity factor of schedule-40 PVC (the white, plumbing stuff) so that you could anticipate the shortening affect... but I wasn't able to come up with a number...

>Dear fellow homebrewers,
>
>I want to build a simple SWR meter which still works at VHF and UHF.
>Specifically, I want it to set up a 70cm antenna. I don't need absolute
>--
>
How about an SWR BRIDGE? I built one loosely based on one in the
"Radio Handbook", by Bill Orr W6SAI, pg 30.34. It's simplicity in
itself. For greatest accuracy use 1% resistors, or hand match them.
keep the lead lengths as short as possible, build it in a small metal
box, and shield the detected output from the rf. For a detector diode,
be sure and use a low-C switching diode, Germanium or Schottky is best,
if you can get one.

Of course a bridge like this can't handle much power, but if you're
going to be tweaking an antenna with power applied, you don't want
to be standing in a strong rf field. I have used this sort of bridge quite
successfully at 440 MHz.

OK, OK, I'll fake a schematic:

```
R.F. input >---o---------o
| |
R1 R2
| |
Reference >---o---R3----o----<To antenna
Load (50ohms) | |
C1 C2
| |
o---CR1---o (orientation of CR1 affects polarity
| | of D.C. output)
R4 R5
| |
GND o---C3---<To Voltmeter
|
R6
|
GND
```

R1, R2: 47 to 51 ohms, non-inductive, match as close as possible.
R3: 51 ohms
R4,R5: 10k
R6: 100k
C1,C2: 1000pF ceramic

C3 1000pF feedthrough
CR1: switching diode. (i.e. 1N34, 1N82, 1N914, etc.)
Reference Load: As close to 50.0 ohms of pure resistance as you can get.

You can calibrate this with some known resistors on the antenna
connector.

>Do you have something else in mind? :)

I believe I posted a thread on this subject where I argued that the ARRL
should step in and put more resources of its publishing empire towards
more agressive home study in electronics and communications.

The basic license is almost a RIGHT, if it's not handed out objectively,
those left out will probably scream bloody murder in federal court.

One need only witness the ongoing waiver question for handicapped
applicants (which I have no problem with, but in a less VAGUELY WORDED
form) to see the kind of legal force someone shut out of ham radio can
muster.

A best case scenario is where a ham takes the basic memorizable, but
objective, test to get the Form 610, and then takes home-study courses
for honorary accredidation in additional technical subjects. These
additional endorsements would be like awards or code proficiency
certificates, they would carry no legal authority or give more operating
privileges. However, like awards, they would be a source of pride for
Joe Ham and would upgrade the technical proficiency of the ham community
at large.

One only has to look at the widespread interest in and energy expended
at the WAS, DXCC, and code proficiency awards to see that something like
this would be in great demand, and would not step into an arena that
should best be left to the federal government.

I know KE3Z from the ARRL reads this newsgroup, perhaps he would like to
comment......

>(A1-Op ... how's this?)

sure, as long as noone is denied privileges for not having it.

3164. RFI from plasma displays

Newsgroup: rec.ham-radio
Date: 1990-11-15 18:58:46 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9011151900.AA05904@ucsd.edu>
Source record: 6574

The recent discussions of RF interference sources like the infamous "touch" lamps prompts this query:

I've always assumed that those "plasma display" toys -- the ones Radio Shack sells as "Lightning Fury" and "Illuma-Storm Light Display", and other places sell under similar names, were *terrible* sources of RFI -- that they would act like Tesla coils and generate vast amounts of wideband hash across the spectrum. But I must admit that this has been just an assumption on my part, based mostly on the fact that a Tesla-coil sort of device I have that is used for testing glass for leaks and demonstrating corona discharge does produce such interference. So I am asking -- do these glass-globed electrical-discharge displays actually produce major RFI, or are they actually less offensive than I had thought?

> Is there a list maintained anywhere that shows what PBBS address a
> particular amateur uses as his main PBBS.

There is a service called the White Pages server that does this. You send a message with a list of calls, and it automatically sends back their packet addresses.

For example, to find out the packet address for K7SS and KT7H, use this format:

SP WP @ AD8I.OH.USA.NA
QUERY
K7SS QTH?
KT7H QTH?
/EX

Make sure that you do this only from the BBS where you normally receive mail, as it looks at your origin on the header to generate the reply. This list is maintained automatically. It gets it's data from messages that are automatically generated each time you check into a packet BBS for the first time, and it queries your home BBS.

When I put on the Digital Suite for rec.ham-radio at Dayton this year, I entered the calls on the sign-in sheet into messages formatted like this. I got a bunch of packet addresses back, which I used to send packet thank-you notes to the attendees!

Hi, Charlie,

It is the *opposite* of what you think -- if it is 100 kHz you are talking about. At that relative size, the equation for an elemental dipole (limiting case of an electric dipole as length approaches zero) will model what you want pretty well. The radiation resistance of the animal is

R = 80.(pi^2).(L/lambda)^2

L is length of the dipole element, lambda is wavelength. For the monopole you are asking about, the radiation resistance is half of this. I think a 3m monopole at 3 km wavelength comes to something like 400 microohms, no?

I suspect you are going to have more ohmic resistance than radiation resistance in the an antenna that size even if you silverplate the sucker. Don't expect very high efficiencies.

Now, if you are really looking for physically-small aerials with high radiation resistance, you might want to look at using slot antennas. [I am currently experimenting with annular slots and comparing them with their duals (physically small loops), to see if I can overcome the ohmic loss problems of the physically-small loops.]

From: BA01@SWTEXAS.BITNET
Message-ID: <9011160009.AA04827@ucsd.edu>
Source record: 6488

Hi folks. I ran into some different broadcast technologies recently that you might find interesting.

1. "Talking Houses"

From American Public Radio's "Marketplace" business show, I heard about a Re-Max real estate dealer in Newton, MA who has set-up low-power commercial AM transmitters in his houses to broadcast taped information to prospective buyers driving by. A sign nearby tells you to "tune to AM 1190" and has a little rack of promotional pamphlets attached to it.

People can turn on their car radio and hear a description of a house, e.g. "This lovely 2-story Victorian features 6 rooms..." etc., etc.
Apparently the agent has sold all 9 houses where he used the transmitters.

Is this something requiring an FCC license? Who sells such equipment?
Is there a sub-band of AM freqs set up specifically for stuff like this and for airport information transmitters, etc?

2. Infra-red transmission

On a trip to Minneapolis, we went to a production at the Guthrie Theater. They had listening devices for rent that amplified signals broadcast in the infra-red frequencies. All I could get from the person at the booth was that the listening devices "decoded" the signals from the transmitter. Can anyone elaborate?

Thanks and 73's.

Do you have access to both Usenet and your local VHF packet BBS?

Can you help me with a little experiment?

I need several packet stations who can do a couple of tests for me, which involve listing some bulletins off of their local VHF packet BBS, and then e-mailing the listings to me on Usenet. This is just a short term experiment, and quite easy.

I need folks in several areas across the MIDDLE of the USA, like in Salt Lake City, Denver, Kansas City, St. Louis, and possibly Chicago, Atlanta, Nashville and New Orleans.

I DO NOT need anyone on the West Coast, in Texas, Minnesota, Ohio, Florida or New York/New Jersey.

If you think you can help, contact me and let me tell you what I need.

Thanks!

Bill misconceptions about my antenna system notwithstanding, this was an experiment to see if 6 dB (1 S unit) more power on 10 meters lets you work more stations. The results tend to indicate that more power is not useful from a communications standpoint, and tends to get into your neighbor's appliances 4 times more loudly. :-o

This effectively answered my questions regarding the efficacy of 11 meter linear amplifiers that I've had since my bootleg CB days; it's an expensive way to heat the outside.

>the first test - can the NoCoders be Gentlemen ?

Not applicable. The Novices got the entire FM repeater subband on 220 MHz
according to the ARRL suggested national band plan (yes, I know some regions
expanded it). In big cities, Novices are NOT in a ghetto and Communicators
would not be either. The rural areas where EVERYONE is on 2m are another
story.

If the subbands are just tiny portions, such as 10%, then there will become
a mainstream of the other 90%.

> You can't ask for a simpler computer-to-radio interface.

If by TCP/IP on CW you mean to encode an IP packet into a stream of Morse
Code symbols, then you lose the ability for humans to directly deal with it.

I believe there are some CW BBS's on the air. If someone releases a really
good Morse decoder program that can handle a wide range of speed variation
and "fist", then these things could become more popular.

We are rapidly approaching a level of technology where what is "simple"
might instead be to just let a robot whip out an instant chip to do it,
and discrete parts as we know it will be in museums.

3179. Usenet UnNet-be there! / 24AT & HF mobile antennas /Intense Mag Mounts

Newsgroup: rec.ham-radio
Date: 1990-11-16 08:04:40 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Nov16.080440.8625@midway.uchicago.edu>
Source record: 6495

****

Don't forget about the Usenet un-net this (and every) Saturday Nov 17,90
1700-1900Z, 28.410 or 28.390 MHz. Basically, call "CQ Usenet".

Pretty bad turnout last week - but I'll be there. And, I'll be taking
names of everyone NOT there.... and sending out negative-QSL cards !
So be there... or suffer the consequences....

****

Here's some other stuff...

==> HT Antennas...

There was alot of discussion about antennas for HT - specifically for the
ICOM 24AT. Well, my own independent tests show that stock ICOM antenna
on the 24AT is about 3 S-units down on recieve over the Larson rubber duck.
It similarly does badly on transmit as I was unable to bring up some distant
repeaters with the stock antenna compared to the Larson.

My choice for a replacement antenna for the 24AT was the Smiley dual-band
tuned whip antenna. The claim for the Smiley is as follows:

2m 1/4 wave (all sections up) 1.2 swr
440 5/8 wave (2 sect. down) 1.2 swr
440 1/4 wave (all sects down) 1.4 sw

The smiley is an 8-section whip thats about 24in when extended and equal
in size to the rubber duck when its collasped.

I was unable to thoroughly test the Larson against the Smiley. But the
Smiley collapsed gave equal receive signal strength with the Larson. We
were unable to thoroughly test transmit performance.

The price of the Larson and Smiley is about the same - $20. I'd go for the
Smiley given that its is "configurable" as described above... and, I
think that just on theoretical grounds (if that counts) the whip should
outperform a rubber duck - if performance is what you need. The Smiley
is not at all flexible ... so its logistically more difficult to deal with.

In any case, if you've got a 24AT with the stock antenna... get rid of it.
I don't understand why ICOM put such a terrible antenna on such a nice
radio. Also, I don't know ICOM doesn't advertise its "extended receive".
This would be a buying decision for some people.

==> HF Mobile Antennas

I've just recently started using HF rig in my car (Kenwood TS-440S). I've
been using Hustler antennas getting pretty good results. Made a couple of
DX contacts today on 10m. Got 5x7 signal reports from Northern Ireland and
the U.K. (Newcastle). This was using the special (shortened) RMX 10m
Hustler antenna (about 57in long).

I have 2 questions.
1) The instructions that come with the Hustler tell you nothing
about these antennas. The RMX antenna is about 57in long. The "standard"
Hustler mast with resonator is about 8ft tall.
Are these cut for 1/4 or 1/2 wave, or what ? If its only 1/4 wave
it means I need a good ground-plane to make it work. If its 1/2 wave I
don't (thats my understanding, at least). The RMX and the "standard"
mast are very different in length but they *appear* to use identical
resonators. So, I don;t know what to make of this.

2) Mounting. As mentioned I kinda like going mobile with the TS-440.
But, as usual the HF antenna is a problem. If there antennas are cut for
1/4 wave then its necessary for these to be mounted over a metal surface
for best performance. If they are 1/2 wave they don't need a ground plane
and could probably be mounted "anywhere".
I've got a IROC Z-28 Camaro and I don't want to "cut it up" too bad
to get a HF mobile antenna on it. Any suggestions?

==> Intense Mag Mount ...

And, I'll just pass this along. If you're looking for a really "intense"
mag mount base... go to your local CB store and get a K-40 mag mount base.

These mag mounts are "industrial strength". Mag mounting the RMX 10m HF
antenna is NOT recommended by Hustler. But, most Ham mag mounts are wimps.
In fact, the Larson PO-MM can't really hold my VHF/UHF Diamond NR-790A.

In fact, the K-40 mag mount is strong enough to hold the Hustler RMX mast
& resonator on the roof of my car @ 70 mph without problem. Basically,
I use a HLM Hustler mount on the K-40 base. It all works out ok and I,
so far, have not had to "cut" my car to add a permanent HF mounting base.

Dear netters (how's that for genderless? :-),

I am in need of any available information for a Yaesu FT-202R Handy Talky. This is an older 2 meter HT which is crystal driven, so rather limited in its use. HOWEVER, these are ideal for Civil Air Patrol usage (which only uses a couple of frequencies) and we have acquired 3 of these radios.....unfortunately, all of them are broken, and we'd like to repair them. I could use schematics, operator's manual, and any other data which may be available for them, including an address of where we might buy crystals for this radio (one of them does not have the correct crystal for CAP frequencies).

Please email me if you have any information on these.

In response to the previous post about Communications Quarterly, I called the indicated number. I was very surprised to find that they are just about to go to print.

I had been waiting (being a former HR subscriber, CQ adoptee, and recent ex CQ subscriber) to get the promo in the mail. The gal didn't know why alot of people didn't get the promo literature - somebody probably put a <not> in the wrong place in an awk script.

In any event, I just wanted to emphasize that if you want to get in on Communications Quarterly then you had better call them. NOW. Don't wait for promo info.

The charter subscription provides for an initial cost of $24.95 with the premier issue being free. The regular rate will be $29.95.

Call 1-800-457-7373. Have your credit card ready as I don't know if they'll accept "bill me" subscriptions.

As a distraction to the marine radio discussion, most of the inexpensive radios have a 10.7MHz IF, probably with low side injection. If you swap the transmit and receive synthesizer RF the radio should operate on 2 meters. For instance, the calling channel 156.800 would become 146.100. Anybody ever tried this?

HIGH number????? A 10 ft whip at 100KHZ will be a LOW impeadance on the order of 1-5 ohms!!!! A 10ft whip is a SMALL part of the wavelength at 100Khz and therefore doesnt even get close to double digits!!

I always liked the government/military method of frequency designation. They assigned frequencies on the basis of the channel center. Hence, for FSK, being assigned to 7709 khz meant your mark and space tones were space equidistant above and below 7709. Similarly, 4595 khz USB on a 3 khz wide channel called for placing the suppressed carrier down 1.5 khz or 4593.5 khz.

It's our old friend Part 15, intentional low-power radiation devices.
If you keep the power low enough, the whole AM band is open to this sort
of stuff. A variation is carrier-current, where you feed the power
lines which leak a little to the buildings they feed.

LPB Corp. (in Pennsylvania, someplace, I think, but it's been a while)
makes low-power AM transmitters, mainly for carrier-current, tunnels,
etc. There may be some others too.

Forgive me if this is the incorrect group for my request.....

I just purchased a used Yaesu FRG-7 (circa 1982?). The unit works very well, and I think I have figured out just about all the controls.

However, it didn't come with documentation and I was wondering if any of you folks had a copy of the documentation, and if I could pay for a xerox copy? I am interested in both the user's and the service manuals.

Please e-mail directly to me.

Thank You for your help,

Marshall Lollis

I'd like to tap into the net.wisdom here. It seems that I've just acquired a lengthy commute(merrily we drone along...), and I would like to put an HF station in my car. I already have a suitable radio (Atlas 210X), and my main concern is antennas. The car is a '76 VW bus. The body is fairly ratty, and I have complete freedom as far as drilling holes is concerned. But I have questions about antenna placement. I have a hustler mobile whip and a Webster band-spanner. The bus is shaped like a tall box, so there is no "trunk lid" to bolt the antenna to, like there would be in a sedan. The easiest thing would be a bumper clamp. But then the whole bottom section of the antenna will parallel the side of the bus. I think that the bus will shield off the antenna from that direction of radiation. Not only that, but a good deal of RF has _GOT_ to be capacitively coupled to the body of the bus. Has anyone had experience with such an install-ation?
If I mount the antenna on _TOP_ of the bus, the whole mess will be way too high for internal parking structures, etc. Heck, it might even ding the bottoms of freeway overpasses. Sure would work well, though. How about mounting the antenna _HORIZONTALLY_ a few feet above the bus roof? Still bad for parking, but freeway overpasses would be okay...

So, does anybody have a solution to mounting HF antennas on busses, vans, etc? Has anybody tried bumper mounts? Do they work as bad as I suspect they might? How about alternate antennas? Maybe a shortened dipole stretched across the roof, with a pole on the rear bumper and another pole on the front? This bored commuter wants to know!

The ideal solution would be to mount the antenna on the center
of the roof top. A way around the problem of height would be
to use a shortened antenna with a top hat. But now we get to
the chosen frequency. You didn't mention that.

A shortened whip with top hat for 14 MHz could be made to be
about 3 or 4 feet high and the top hat would have to be about
2 feet in diameter. To get the height scrunched down that
much you would also have to use an inductance between the
vertical section and the tophat. This all results in some
losses but local ham whom I helped design such a beast
runs a KW to it and gets all over the world with it.

Don't know if the height I mentioned would still be too
high, though, when mounted atop a VW bus. My friend runs
it on one of the rails of his pickup.

Do it like the automotive training competitions. Present the applicant with
a carefully broken radio and score him on how quickly he locates and repairs
the trouble. Deduct points for replacing good components or for damaging
good components in the course of troubleshooting. I have some fiendishly
intermittant parts I'd be happy to surface mount in your HT for the exam.
:-)

I seem to recall a piece in QST, perhaps 1985-1986 about a bloke
with an R71 RX. He had dismantled the set and had accidentally placed the
CPU board ontop of tools on his bench. This had caused the battery
backed RAM to be cleared. I believe he said that reprogramming could
not be done in the US - it had to be returned to J-land.

I know that I personally have nothing at risk, but some people
are going to spontaneously acquire surprisingly expensive component
collections.

Some manufacturers, and I dont know which, have got themselves a nice
little time-bomb ticking away out there in the field. Short of free
replacement sets or a full-price buyback scheme it is now too late for
them to do anything about it.

No reviews seem to have covered this matter

this must be the best place to share information as the equipment
starts to die. The ARRL and RSGB etc presumably will not risk
their advertising revenue.

AMEN Brother, where do I sign up. Just kidding. The DSP'ers workbench
if being put together for two different products at this time. The DSP-X232
by AEA and the TAPR/AMSAT DSP plug in communications board. This will be
libraries, source, programming models, example modems, FFT's for spectra,
and much more with design tools written by me. There is another offering
for amateur radio, this is LL Grace's advertised DSP-12 as seen in several
magazines. CAVEAT EMPTOR. Today is Friday Nov.16 and as of last weekend

(1) The DSP-12 HAS NEVER HAD A MODEM RUN IN IT ON THE AIR
(2) HARDWARE ISSUES ARE <<<_STILL_>>> being worked on and
(3) Contrary to LAW, the unit is being marketed WITHOUT FCC type acceptance.

To the best of my ability to find out, the unit has not been submitted for
FCC type acceptance since it DOES NOT YET WORK. 40 modems is to say the
least, an exaggeration.

Truth-in-advertising: I am the founder/leader of both the TAPR/AMSAT
and AEA projects. The former is joint with W3IWI,WA7GXD. The first
of each units are now in the hands of Alpha/ Beta testers for TAPR/AMSAT
and AEA respectively. AEA will ship more to the ALREADY CHOSEN Beta
testers over the next couple of weeks. The most onerous task of providing
a manual for thing is now joined in earnest. It is FINALLY the time
to get ready for DSP to make a true impact on ham radio.

Source record: 6512

Charlie,

I think it is a pretty small number too. I don't remember the details very clearly but maybe someone from NIST can comment on WWVB's (60 KHz) antenna farm. I seem to remember it being a 200' tower with heavy duty capactive hat loading. Even combined with a large room basically full of matching network (I think you can stand up inside the inductor which is no doubt silver plated) the overall efficiency is under 2 percent or so. SoI don't think that WWVB actually radiates much more than many amateur stations on 20M.

> >Is the display operating properly?

Well, about half the frequencies were added at a later time,
when the current equipment state of the art could support
closer channel spacing.

The Marine Band channels US / International:

Is such "openness" limited to the AM broadcast band? Or does it
apply to the _WHOLE_SPECTRUM_? If it doesn't, how does anybody dare
market RF signal generators?

3201. Amtrak odessy coming....

Newsgroup: rec.ham-radio
Date: 1990-11-16 20:56:00 UTC
From: PERRYR@WABASH.BITNET
Message-ID: <9011162250.AA01986@ucsd.edu>
Source record: 6517

This Christmas, I am going home via Amtrak (from Indiana to New York).

I'm really looking forward to it, actually. I have a sleeper, and have always loved travelling by train.

While I'm aboard, I though it might be a great opportunity to get some unique QSO's (how many xx2xxx/train mobile calls have YOU worked?), but I need some help with an antenna. I'm going to be working 2 Meter, and I was wondering what kind of antenna I should use. I'm going to be on my HT. The last time I tried this trip (going west) I used a magmount that I put on the window casing. I thought I might get better reception if I used a dipole mounted on the glass. Does anyone have any thoughts?

On the same note, I would also be interested in knowing the Amtrak freqs. My 2M HT goes from 136-174, so if there are any SWLers out there, I'd appreciate learning the freqs in use on the train itself, and in the Chigago and New York yards. Actually, I'm hoping that there will be an accident, so that I can use my non-type accecpted gear on their freqs. >:-)

In any case, I gotta go study more and more and more.....

>L is length of the dipole element, lambda is wavelength. For the monopole
>you are asking about, the radiation resistance is half of this. I think
>a 3m monopole at 3 km wavelength comes to something like 400 microohms,
>no?

I think you are both correct. The original question asked about the
feed point impedance, not the radiation resistance. The feed point
impedance will be the radiation resistance in series with a very
large capacitive reactance. Thus the magnitude of the feed point
impedance will be a high number because of the reactive component,
even though the real part is small.

3203. DXpedition next week

Newsgroup: rec.ham-radio
Date: 1990-11-16 21:08:51 UTC
From: dhp1@GTE.COM
Message-ID: <10058@bunny.GTE.COM>
Source record: 6519

A small group of us will be heading for Little Cayman Island, B.W.I. next week (Monday) to have some fun in the sun and operate in the CQWW CW Contest (mutually exclusive events).....

The group will consist of: Dave KM3T/1 (ZF2PT)
Paul K1XM (ZF2PR)
Charlotte KQ1F (ZF2PQ)
Tony K1KP (ZF2PS)
Michelle (Tony's XYL)

We will be active on all bands (160-10m) and I will be active on 50 MHz periodically during the week. I am open to skeds on 6m if anyone so desires. Just send me e-mail this weekend....I'll check e-mail periodically and then once again late Sunday night. Send along date and time for skeds and I'll be there.

Otherwise, please work us both outside and in the contest....we'll be active on both phone and CW before the contest, and possibly some RTTY during the week. Our call in the contest will be ZF2PR....

Please look for us....hope to work many of you from the net....

73

3204. Summary of 900 TX mod for IC-24

Newsgroup: rec.ham-radio
Date: 1990-11-16 22:48:01 UTC
From: vail@tegra.COM
Message-ID: <1753@atlas.tegra.COM>
Source record: 6520

I had recently inquired about a 900 MHZ transmit mod for the IC-24. I
recieved a couple of responses, leading me to believe that the mod is
not worth doing. It is a hack-and-a-half and not a useful mod.

The replies are summarized below. Thanks to those that responded.

jv <- "Of course the recieve mod is trivial *and* useful"

---

you should be able to *receive* 900 mhz, but only a rare 24at can transmit
there. Apparently it has to do with the variable quality (on the leading
edge) of internal circuit components.

There are then some additional diodes that need to be changed around.
A friend of mine attempted this with his 24at, but it was unsuccessful.

Walt Spector KK6NR
(wws@rena.cray.com)

This mod does not work .... the author of the mod admitted to
this in a phone conversation I had with him. What you get from
the mod is just a 2nd harmonic of a 450 MHz signal.. and a weak
one at that.

>bad as I suspect they might? How about alternate antennas? Maybe a
>shortened dipole stretched across the roof, with a pole on the rear
>bumper and another pole on the front? This bored commuter wants to
>know!
> - Jerry Kaidor, KF6VB

I have the same problem. I called Hustler in Texas and got the following
info/advice.

1) The Hustler 54in MO-1, MO-2 mounts with resonator are 1/4 wave antennas
so they need a good ground plane.

2) The best place to mount them is on the roof. The worst place is on the
bumper as there is too much parallel metal. Trunk mount is "ok" but
not as good as roof mount.

3) The special RMX has a shorter mast and slighly
longer top whip section. The RMX also has less wind load than the MO
masts + resonator.. which makes them 8 ft tall. Since the guy at
Hustler told me the RMX was 1/4 wave ... and resonators were interchangable
with the MO masts... I tended not to believe the RMX was *really* 1/4
wave. However, if I can talk to Northern Ireland and the U.K. with
the RMX from my car... by experience, I'd say that even though the RMX
is not really a 1/4 wave.. it works just fine.

As regards the "parking structure problem", Hustler has a "fold over" mast
thats only 22in in height when folder over. That might work for you.

The guy at Hustler in Texas also told me that all these mobile antennas
also work well for non-mobile operations. The recommendation was for a
8ft X 8ft layer of "chicken wire" under the Hustler to supply the ground
plane... :-)

In article <9011162250.AA01986@ucsd.edu> PERRYR@WABASH.BITNET (GWYFFD) writes:
>This Christmas, I am going home via Amtrak (from Indiana to New York).

I've used my HT succesfully on long bus trips, so let me suggest some
pointers.

The most important part of any ham station is the antenna. A rubber
duck inside a metal container doesn't work very well.

I purchased a collapsable 1/4 wave antenna and clamped a large suction cup
to it (can be found in any decent office supply store). I then attached
a 19 inch long counterpoise to the clamp to act as an artificial ground. The
whole contracption is then suctioned to the bus window.

This works great! I can hit repeaters many miles away - much better
than a rubber duck.

I also use a 5 amp-hour gel-cel I purchased as Dayton. This conserves
my nicads and provides the 12 V input that my IC-24AT requires for 5 watts
output.

Good luck. Time to get into training so that your plans are not
derailed and you're driven loco.

DX BULLETIN 46 ARLD046
FROM ARRL HEADQUARTERS
NEWINGTON CT NOVEMBER 16, 1990
TO ALL RADIO AMATEURS

THANKS TO ALLEN SINGER, N2KW, AND THE TRISTATE DX PACKETCLUSTER NETWORK, DR. RICK DORSCH, NE8Z, AND SALIM AL-KITANI, A41JV, FOR THE FOLLOWING DX INFORMATION.

AFGHANISTAN, YA. AN UZBEKI, A FRENCH EMBASSY EMPLOYEE, AND A GROUP OF EAST COAST DXERS ARE ALL PLANNING OPERATIONS FROM KABUL DURING 1991

ALBANIA, ZA. THREE ALBANIAN OFFICIALS WERE ENTERTAINED IN BUDAPEST FOR TEN DAYS, AND OBSERVED AMATEUR RADIO IN ACTION. A JOINT HUNGARIAN-ALBANIAN OPERATION IS BEING DISCUSSED WHICH WOULD ESTABLISH A PERMANENT ZA CLUB STATION. APPARENTLY, THERE ARE SEVERAL SEASONED CW OPERATORS IN THE MILITARY WHO WOULD LIKE TO TRY CONTESTING.

ANGOLA, D2. THE RUMOR MILL HAS DJ6SI TARGETING THIS ELUSIVE DX SPOT.

BANABA, T33. ONLY 5 DAYS LEFT TO WORK T33R OR T33T. THEY HAVE BEEN ACTIVE ON NINE BANDS, OFTEN CALLING CQ WITH NO ANSWERS.

BRUNEI, V85. V85OM BY N2OO WILL GO QRT TOMORROW. TRY 21027 KHZ AT 0000 UTC OR 14027/14165 KHZ AT 1100 UTC. QSL VIA N2OO.

CROZET, FT8W. FT4WC IS EXPECTED TO COMMENCE OPERATIONS THE MIDDLE OF DECEMBER. QSL VIA F6GVH.

EAST MALAYSIA, 9M6. CW OPERATIONS BY 9M6OO NOVEMBER 16 TO 30. ALSO, 9M6NA NOVEMBER 21 TO 26. POSSIBLE SSB ON 14165 KHZ AT 1100 UTC.

FAROE ISLANDS, OY. OY9JD LOOKS FOR WEST COAST STATIONS ON 28490 KHZ AT 1800 UTC.

JUAN FERNANDEZ, CE0Z. TWO DAYS REMAIN TO QSO CE0ZZZ. ALL TIMES UTC. 7 MHZ AT 1000, 14 MHZ RTTY AT 1100, 14 MHZ SSB AT 1200 AND 0300, 28 MHZ SSB AT 2200, 24 MHZ SSB AT 2300, 21 MHZ SSB AT 0100 AND 14 MHZ CW AT 0200. THEIR SATELLITE SIGNAL HAS BEEN VERY STRONG.

LIBYA, 5A. RUMORS PERSIST OF A 5A0DX OPERATION FROM NOVEMBER 17 TO DECEMBER 8.

MARION ISLAND, ZS8. ZS8MI HAS BEEN ACTIVE ON THE 20 METER LONG PATH AT 1300 UTC. TRY 14226 KHZ OR 14260 KHZ ON SATURDAYS. POINT YOUR ANTENNAS TO THE WEST.

MALYJ-VYSOTSKIJ ISLAND, 4J1. JANUARY PLANS FOR THIS OPERATION HAVE BEEN POSTPONED UNTIL MARCH, 1991. INCLUDED WILL BE 160 METERS, RTTY, AND AROUND THE CLOCK OPERATION.

MEXICO AND SANTA MARGARITA ISLANDS, XE3. DR. RICK DORSCH WILL BE OPERATING FROM VARIOUS AZTEC AND MAYAN INDIAN RUINS IN MEXICO FROM NOVEMBER 30 TO DECEMBER 11. HE WILL ATTEMPT TO OPERATE FROM SANTA MARGARITA ISLANDS, IOTA, NA-78, BETWEEN DECEMBER 6 TO 8. WITH ONLY 25 WATTS, HE WILL USE THE 10 METER IOTA SSB FREQUENCY OF 28460 KHZ OR 28005 KHZ ON CW. LISTEN FOR XE3/NE8Z. QSL TO K8LJG, JOHN C. DROLL, 3528 CRAIN DRIVE, FLINT, MI 48506, USA.

OMAN, A43. A43SR/MM WILL BE OPERATING FROM OCTOBER 23 TO MARCH 10, 1991, DURING THE 100 DAYS OF SAILING THE SILK ROADS MARITIME ROUTE FROM VENICE, ITALY TO OSAKA, JAPAN. THE OPERATION ON BOARD THE OMANI YACHT, FLUK AL-SALAMAH, WILL INCLUDE OPERATION ON 80 THROUGH 10 METERS. THANKS TO SALIM AL-KITANI, A41JV, OF ROARS, FOR THE INFORMATION.

PENGUIN ISLAND, ZS1. LOOK FOR ZS9Z/ZS1 STARTING NOVEMBER 27TH. THE SIX DAYS OF OPERATION WILL INCLUDE TWO STATIONS ON NINE BANDS RUNNING CW, SSB AND RTTY.

ROTUMA, 3D2. VK2BCH IS NOW ACTIVE AS 3D2XV. TRY 14222 KHZ AT 0330 UTC.

SAN FELIX, CE0X. XQ0X OPERATION WILL BEGIN NOVEMBER 20. OPERATOR JUAN IS A LOBSTER FISHERMAN, WHO SPEAKS NO ENGLISH. HE WILL VISIT NETS FOR LIST OPERATIONS. WATCH 14242 KHZ OPENING DAY. JUAN DOES NOT OPERATE CW, SO DO NOT ASK FOR CW. HE WILL BE OPERATING ONLY AS HIS WORK SCHEDULE ALLOWS. QSL VIA CE3ESS.

USSR, OBLAST HUNTERS TAKE NOTE. OBLAST 020 HAS BEEN DIVIDED AGAIN, REINSTATING OBLAST 179 EFFECTIVE AUGUST 17, 1990. UL-O REMAINS OBLAST 020, WHILE UL-A IS THE NEW OBLAST 179, MANGISTAUSKAYA.

UZBEK, UI8. UI8ZAA HAS A POTENT SIGNAL ON 20 METER SSB AT 0300 UTC. ALSO, LOOK ON 10 METER SSB AT 1300 UTC. THE OPERATOR SAYS HE IS GOING TO AFGHANISTAN IN 1991. QSL VIA K9FD.

VATICAN, HV. HV3SJ, ON CW, BY N6AR, NOVEMBER 13 TO 18. QSL TO I0DUD.

FOOTNOTES. TP5HA WELCOMES HUNGARY TO THE COUNCIL OF EUROPE, NOVEMBER 16 TO 18 FOR CW AND NOVEMBER 23 TO 25 FOR SSB. QSL VIA F6FSQ.

GW3WQU/4U IS ACTIVE FROM BELUCHISTAN. THIS COUNTS AS AP FOR DXCC.

ARRL HEADQUARTERS AND W1AW WILL BE CLOSED NOVEMBER 22 AND 23RD FOR THE THANKGIVING HOLIDAY. THE NEXT DX BULLETIN WILL BE SENT ON W1AW FRIDAY, (UTC) NOVEMBER 30.

One more item about operating a ham station aboard a train...

My cousin's brother-in-law knows a lawyer who thinks he once read that
operating any kind of transmitter aboard a train is against ICC regulations,
even if one has the expressed written consent of the train's captain.
Any spurious rf transmission could accidently trigger the train's sanitary
dumps in the lavatories. The sensitive navigation system could also
be affected, causing the train to go off course.

Furthermore, he states that the ham tranceiver may be confiscated during
the pre-boarding carry-on luggage inspection.

Any of the myriad wannbe Perry Mason's out there know for sure?

I disagree with all the other posters so far. The impedance will
be HIGH, not low. Sure the radiation resistance is small, but the
capacitive reactance is high.

10' is about .001 wavelengths at 100 kHz, so if I remember correctly,
Z is roughly .0005 - j 20000 ohms. This is theoretical, of course,
and doesn't include loss resistance.

> Ken - WB0QNA
> ----------

And that reminds me of an interesting story. You will find that most marine
radios do *not* have a 10.7 MHz. IF, but actually it's at 16.8 or 16.9 MHz.
This is because the very strong coastal telephone stations happen to be
offset just about exactly 5.35 MHz (to allow full duplex operation), and
this half-IF frequency causes intermods that are *very* difficult to get
rid of. The pioneers in VHF Marine Radio, such as Konigsberg Electronics (Konel),
learned this the hard way. The chief engineer there (Mr. Al Bennett)
decided to move to a higher IF and consulted the crystal filter vendors about this.
They said anything below about 17 MHz. was just as easy as 10.7,
but above that, the cost went up. So he picked 16.9. The rest of the
industry followed, sometimes after rediscovering the hard way why 10.7
was not used. Motorola uses 16.8 MHz. for some unknown reason
(maybe just to be different).

3218. Electrically short antennas

Newsgroup: rec.ham-radio
Date: 1990-11-17 17:36:20 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9011171736.AA05941@cmr.ncsl.nist.gov>
Source record: 6278

I haven't been following this line very closely - or mail machine has been sick most of the week - but there seems to be a LOT of confusion being promulgated. I have NEVER earned my living designing natennas, but here goes:-

Probably the basic confusion is caused by whether you are considering the series or parallel equivalent circuit of the anetnna. In either case the thing looks like a capacitor and a resistor (the radiation resistance). There is also the resistor which corresponds to the antenna resistive losses. I think that the performance of short antennas can be understood better using the series equivalent circuit: a series combination of the (resistive) losses in the loading coil, antenna conductor, and ground system; the very small radiation resistance of the antenna; and the capacitance (to everywhere) of the antenna. The series impedance is high, but the useful part, the radiation resistance, is very low.

The radiated POWER is the power "dissipated" in the radiation resistance Pr = Rr * I^2 . Thus you need to get as much current flowing in the antenna as possible. But where can it go? Ah ha, it goes into the capacitance of the antenna, and it's easier to get a lot of current flowing in an electrically large capacitor, thus the large "top-hats" on LF antennas. But this same current also flows in the ground circuit and the loading coil and the actual (not radiation) resistance of the antenna conductor. All the "I^2 * R" loss in these represents wasted power. Thus the need for LARGE conductors so the copper resistance will be as low as possible compared with the radiation resistance - which is very low for electrically short antennas.

I hope this is of some use, 73 Bob W3OTC

3219. The UN-NET was busy today!

Well - we had quite a turnout on the Un-Net today! I logged:
N8EMR - gary
WA7LDV - Jim
KE9ZM - Gary
NV3Z - Michael
WA1RHP - Tom
W5RRRR/K5ZC - Jay
N4YRJ - Peter
N4BYO - Jim
N5KNX - James

and a couple not affiliated with Internet/Usenet/Bitnet/Fidonet.

We discussed what to do about the endless debates (code-nocode,
out of band mods, HT's on airplanes, etc). We found out how Jay
got the moniker "The Ignorant Splut." We heard what various folks
did for a living and how they connected to the computer side of this
network.

In general, a good time was had by all, even though there was a lot
of QRM and variable propagation.

As I write this, Jay K5ZC has taken over net control and it is rolling
along.

Join us on Saturdays, 1700Z... on 28390-28410 (this time we we at 28390.30)!

Message-ID: <9011172013.AA04199@blackbird.afit.af.mil>
Source record: 6281

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I recommend Oppenheimer and Schafer's new book, "Discrete-Time Signal
Processing". It's clear enough that you can cookbook stuff out of
it, with some real info (like signal to noise ratios from roundoff)
that I hadn't found in older books.
Prentice Hall, 1989

Subject: FINAL WARNING
To: ALL RADIO AMATEURS
>From: Robert J. Carpenter, W3OTC

On or about Monday, 19 November 1990, I shall begin transmitting on the 50 MHz band from the island of Guadeloupe as FG/W3OTC. I expect to continue to operate in the general vicinity of 50.110 MHz until the evening of 1 December, 1990, unless the lure of the beach should overcome me.

> not be done in the US - it had to be returned to J-land....

I was the guy who published that note in the 1985 QST, although I
posted this on USENET first:

LOSS OF ICOM BACKUP BATTERY FORCES
REPROGRAMMING OF RAM

A friend from Wheaton (MD) asked me to post this warning:

If you own an ICOM R71, 751, 271, or 471,
don't disconnect the lithium battery on the
memory board!

All these models use a common $17 memory plug-in board
which contains 2 IC's (one a Japanese 2114 RAM) and a
lithium battery.

This fellow wanted to experiment with the memory cir-
cuit, so he disconnected the battery in order to
install a socket for the RAM.

His radio didn't work when he reconnected everything,
and a call to ICOM confirmed that the RAM contains the
microcode which gives each model radio its own per-
sonality. His board is on its way back to ICOM for
reprogramming, which can't be done at the dealer's.

For ICOM owners, this means that when the lithium bat-
tery runs down (7 year life), the memory board must be
sent in for reprogramming.
....
This fellow is contemplating using his home computer,
which uses 2114s to determine the contents of the ICOM
RAM, and is looking for other suggestions. It would be
useful to modify the contents of the RAM to permit out
of band reception.

> No reviews seem to have covered this matter..
> .... The ARRL and RSGB etc presumably will not risk
> their advertising revenue.

Don't sell the ARRL short. It was Gerald Hall, Associate Technical
Editor of QST, who sought my permission to reprint this information
in QST to warn others.

In his March 28, 1985 letter to me, Hall said "We feel an obligation
to make ARRL members aware of this situation, and one of the best
ways would be to publish your bulletin .... [in] QST."

ARRL BULLETIN 46 ARLB046
FROM ARRL HEADQUARTERS NEWINGTON CT
NOVEMBER 17, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

The FCC has released a Notice of Proposed Rulemaking in PR Docket
90-561, proposing minor technical amendments to Part 97 of its Rules
that had been requested by ARRL. Other amendments requested by ARRL
and three individual petitioners were denied.

ARRL had requested a number of amendments to clean up minor problems
arising from the Part 97 rewrite adopted last year. FCC is
proposing to adopt new definitions for Bandwidth, Space Telemetry,
Telecommand, and Telemetry, minor changes in rules governing
telemetry and telecommand, and other clarifications.

The comment deadline is January 31, 1991, with reply comments due
March 4, 1991. More information will appear in January QST.

3229. Preliminary call for discussion: rec.ham-radio.legal

Newsgroup: rec.ham-radio
Date: 1990-11-18 06:09:22 UTC
From: jmaynard@thesis1.hsch.utexas.edu
Message-ID: <4330@lib.tmc.edu>
Source record: 6289

As John Moore, NJ7E, mentioned in his message about the Usenet Un-net today, we discussed possible solutions to the continuing flame wars in this group. I mentioned that I thought that a new group would do it, and nobody thought it was a bad idea, so...

This is a preliminary call for discussion for a new group, to be called rec.ham-radio.legal. The intent is that all discussions about the myriad legalities surrounding ham radio (pizza on the autopatch, out-of-band radio mods, code/no-code, ad nauseam) be moved off there, while rec.ham-radio would continue to carry the more general stuff.

The rationale for .legal is simple: by far and away, the majority of the subjects of flamage in the group are about legal issues and interpretation of the rules and regulations, or proposed changes to the rules and regulations, governing the amateur service. This avoids the narrow focus of the previous call for rec.ham-radio.licensing a year or so ago.

If no serious objections arise in the next week, I intend to start a formal Call for Discussion in news.groups in a week or so. Let's kick it around, and see if we can reach a consensus. I'd like to see a finished proposal ready to go before the news.groupies have a chance to flame it, and hashing out the issues here will improve the group's chance for success.

3231. POTENTIAL MAJOR FLARE WARNING

Newsgroup: rec.ham-radio
Date: 1990-11-18 08:28:30 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901118012830.20401ce1@HG.ULeth.CA>
Source record: 6291

/\

POTENTIAL MAJOR FLARE WARNING

ATTENTION ATTENTION

/\

12:00 UT, November 18

ATTENTION:

A massive sunspot group has developed and is currently located at approximately N19E19 as of 12:00 UT, 18 November. This sunspot group has the potential to produce a major class M or X flare. It consists of 78 spots clustered within a Beta-Gamma-Delta magnetic configuration, covering an area of 9,000 million square kilometers (5,600 million square miles)! This Region (6368) is currently a type FKI optical region and has produced three class M flares over the past 24 hours.

THIS REGION HAS THE POTENTIAL TO PRODUCE MAJOR ACTIVITY.

The Space Environment Services Center estimates a 25% to 35% probability of a major class X flare occurring from this region over the next 72 hours. There is an estimated 80% probability of moderate-level M-class flare activity occurring from this region over the next three days (minimum). There is a 15% to 25% probability of a major proton flare erupting from this region over the next 72 hours. The Space Environment Services Center has issued a condition YELLOW alert status for potential PCA and satellite-level proton events for the next 24 to 72 hours at least. The risk for strong PCA and proton event activity will increase as this region moves towards the western solar hemisphere.

Region 6368 has grown in size and complexity over the past 24 hours. Two delta-configurations have developed in the trailer spot complex of this system over the past 24 hours. This region has the potential to produce some potent activity.

There is a strong potential that a moderate to high intensity SID (Sudden Ionospheric Disturbance) accompanied with a moderate to high intensity SWF (Short Wave Fade) may occur as a result of major flare activity over the next 2 to 5 days on the sunlit hemisphere of the earth. SID and SWF durations could exceed 80 to 120 minutes. Polar regions are at risk for strong PCA activity over the next 2 to 5 days, depending on further developement of Region 6368. Users of polar ionospheric properties (ie. radio operators, researchers, etc.) should be on the alert for potential PCA activity. Satellite users should be on the alert for potential proton events and

associated potential satellite disruptions.

Region 6368 might not produce any major flare activity. However, the evidence would seem to indicate otherwise, considering the size, magnetic complexity, and spot density of this major system. Should a major flare occur, a major flare alert will be issued with details concerning the event.

3232. UnNet/ Drop in ICOM 24AT price/ New AES catalogs/ 24AT antenna problem

Newsgroup: rec.ham-radio
Date: 1990-11-18 09:55:01 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Nov18.095501.5448@midway.uchicago.edu>
Source record: 6292

(** Late note - Other people beat me to this un-Net log .. but I did copy QTH
and a few other "popin" participants)

Usenet UnNet ....

Pretty successful net this week... but were we plagued by some propagation
problems. We had about 12 sign-ins on the 29.390 freq. But, not everyone
could hear everyone else. I think John (NJ7E) running power and running a
beam was the only one who could hear everyone else and also be heard. So, he
became our net control for the first hour. (And, also had the additional
burden of "summarizng" things during the rotation so we could all know what
was being said.)

Not to waste the beautiful day in Chicago (sunny & 60 deg) - not a common
thing these days... I went mobile with my TS-440 & Hustler Vertical. To
the best of my driving/writing/talking ability... (and now that I got that
disclaimer out of the way) here's what I copied for sign-ins

NV3Z Mike in Maryland
NJ7E John ... Arizona
WA7LDV Jim ... Oregon
K5ZC Jay ... operating the W5RRR station in Texas (Johnson
Space Center - I think ..)
N8EMR Gary ... ?
KE9ZM Gary ... me in Chicago, Ill
N4BYO Jim ... Raleigh, North Carolina
N4YRJ Peter .. Durham, North Carolina
WA1RHP Tom ... MIT in Mass. running (if I caught this right..
an all solar-powered station)
N8IXR ???
N7JYC ???
N5KNX ???

I may have gotten this a bit wrong as propagation conditions were not the best.
Also, a few non-UseNet people popped in to see what was going on.

Also, thanks to Jay in Texas for taking over as net control after John had
to take off. I couldn't stay on for the entire net... but, I think we had
a good turnout. Possibly other people signed-in in the second hour after
I left.

Jay wrote...
> Actually, the TS-950 I was using (that Kenwood graciously donated to the
> Johnson Space Center ARC [gotta get that plug in!]) claimed we were at
> 28390.29. Nyah. :-)

My TS-440S didn't say 28390.00 either... but, the first call I heard was
NV3Z (Mike) and I tuned in on him and then John and the rest came in.
So, we were off freq.. a bit.

So much for that...
... Drop in ICOM 24AT price.

Here's some real news.. and some may already know. I have it on excellent
authority that the price of the ICOM 24AT will drop by $50. So, if you've
been waiting... here's your chance.

But, don't forget that the ICOM 24AT does NOT come with a PL tone unit(UT-51).
Thats an optional $50. So, in essence, the price of the ICOM 24AT is now
more in line with the other vendor models that include the tone unit as a
standard feature.

AES "old" price is $549. (And throw in another $25 for the Larson Rubber
Duck)

New Catalog from AES

The new Catalogs from AES will be in the mail this week. The "center-fold"
is now new SONY products with Ten-Tec on the cover. Prices in the preliminary
copy I saw were not up to date - the final version may have this corrected. For
example, the ICOM-24AT did not show the price reduction. (Ham Radio Outlet
solves this problem by not giving any prices... which I don't like at all).

Possible ICOM-24AT antenna jack problem...

This happended to me... don't let it happen to you. I do alot of antenna
changing... I take my 24AT mobile, so I switch between by Smiley whip
and a Coax on a daily basis.

If you find that you antenna jack has become loose in any way... tighten
it immediately! The BNC connection is soldered to an "inflexible" tiny
component inside the radio. So, continued twisting of the loose jack -
even in small amounts.. will break the solder joint and/or the wire
component lead. (Maybe mine was poorly soldered in the first place.. ?)

In any case, after I got this fixed, and, after I discovered that I just
couldn't get the BNC connector tightened down good enough (What *IS* that
thing that holds the BNC to the connection - whew !). I did the following.

Now, I'm sure everyone will cringe at this... but it *did* solve the problem
of my loose BNC connector - (possibly forever!). I tightened the "ring"
(really, what do you call that ?) and put a drop of Lock-Tight on it.
So, if Lock-Tight will hold the various screws and nuts on my motorcycle
at 13,000 RPM - I figure it will hold the "ring" on the BNC connector -
and, it does.

>ding the bottoms of freeway overpasses. Sure would work well, though.
>How about mounting the antenna _HORIZONTALLY_ a few feet above the bus
>roof? Still bad for parking, but freeway overpasses would be okay...

Well, I remember a QSO I had with a mobile amateur late one night on
75 meters. He was running 550 watts into an endfed quarterwave antenna
mounted horizontally one foot above the cargo box of his eighteen
wheeler. He said it worked great. He sure had a nice signal. I don't
know how effective a shortened antenna would be mounted close above
the roof of your bus. I would tend to think that there would be large
losses to the top of the vehicle similar to the losses you would experience
with a bumper mounted short vertical. I seem to remember some articles
in the ham press about an antenna called a Discontinuity Ring Radiator
that might be just the ticket. This is basically a broken horizontal loop
mounted very closely over a groundplane. As I recall, matching was
fairly critical but efficiency was high.

>for placing the suppressed carrier down 1.5 khz or 4593.5 khz.

This method has a lot of merit. You can easily visualize where your tones will appear in the band and the math is simple. Hams use the method I described though because it allows them to read the named frequency directly off their tranceiver readout. If they care where their tones actually appear in the band they have to add the offset, but except near the edge of the band most don't really care about this.

>
>Bill

Probably because the repeaters are being used for personal communications
between private individuals which was also the original charter of CB.
Of course the FCC screwed that one up by using a band with skip and
saddling the users with amptitude modulation and no repeaters. Add in too
many reruns of the movie "Convoy" and CB turned into a mess. Before
the pseudo-trucker craze, at the sunspot minimum, CB sounded very similar
to many of our VHF/UHF repeaters used by commuters. Except for the
autopatches and talking, beeping, tune playing, repeater controllers. :-(

>impedance will be the radiation resistance in series with a very
>large capacitive reactance. Thus the magnitude of the feed point
>impedance will be a high number because of the reactive component,
>even though the real part is small.

Whoops, Charlie, Ed (WA2SRQ) is right, of course. I completely
forgot to look at the reactive term. It should have occured to me
that the darn thing better start looking like an open circuit as
you approach DC. Dumb!

Well, as penance (actually, more of curiosity), I search through some
books to see if there are any tables that take you into the 0.001 lambda
region. Kraus (2nd ed), for example, has a parametric plot on the R-X
plane down to 0.2 lambda (1/2 dipole of 0.1 lambda). Wolff has precisely
the same plot, but on Smith chart instead of cartesian (hmmm...).
But I couldn't find anything else that would take me lower.

Well, I don't have NEC (nor miniNEC), so I decided to start at the
1st-order Hallen equations and did some numerical integration. I found a
large variation on the diameter of the wire you use -- so, here is a list
that may be useful (again, values are for a 6m dipole; half the reactance
for a 3m monopole):

6m dipole at 100 kHz

Element radius (cm)	Reactance(kOhms)
0.1	-110
0.3	-89
0.5	-80
0.7	-73
0.9	-69

(Eeek, -100 kOhms at 100 kHz is about 15 pF - bletch! you won't believe
the size of the inductance you will need to tune this sucker out - start
looking for a couple of surplus "88 mH toroids" :-) Two of them might
just do it :-) :-).

I don't really know how good these numbers are, since it was a quick
C hack that I did in the middle of the night. It wasn't a complete waste
of time; 20m was pretty dead by then anyway, except for W6YX blasting my
speaker with "CQ SS" and having to repeat "28 Santa Clara" because no one
believed 'YX has been around for that long. :-)

The increase in the magnitude of the reactance as you make the elements thinner seems to make sense. I.e., capaciatance increases as you make the elements fatter.

Anyway, the numbers I get for the region from 0.2 lambda to 1 lambda agree well with the figure in Kraus, so maybe they are OK. For the integration, I chopped the dipole into about 80 pieces (not so bad on a MacCX; and only took a few seconds on the MacCI when I ran it here at work).

Another thing that I discovered while playing with the integrals: making the assumption that an elemental dipole models a small dipole is *not* that good. You can be off by up to a factor of 4. The reason for that is because elemental dipoles assume a constant current through the entire element, whereas even a small dipole will necessarily have the current at the tips of the dipole be at zero. Good ole' boundary conditions :-)

Now, QSY back to pizza wars.

I would like to see some specific reasons for the establishment of yet another ham group. Proponents should take advantage of the opportunity to lay out all their reasons for such. I get the feeling that some folks are outraged by any sort of controversy - they call it "flaming". Everything that is not milky bland or highly technical or supportive of the (genuflect) ARRL is to be shunned by the enlightened - right?
Come on folks, let's not become too stultified. Sure, the code-no code discussion seems unending. So what? I would really prefer to exclude all the mentalities that are horrified ("bored") by controversy. Reasoned arguments are the spice of life. Even the Russians are able to disagree now without being sent to Siberia!

3241. need info/Yaesu MiniCAT interface

Newsgroup: rec.ham-radio

From: plonka@carroll1.cc.edu
Message-ID: <2143@carroll1.cc.edu>
Source record: 6301

I'm looking for information on Yaesu's miniCAT (Computer-Assisted Tuning) connector on my 727R HT. In the past I've heard that this info is difficult to come by... I've heard it's a 4800 baud serial port.

I picked up an interface to it for the Commodore 64. (It turns out the guy who sold it to me had put it together wrong. It was easily fixed by following the intstructions.) Now it works, but I want to build one for RS232 to use on my Amiga.

What I really need is a list of instructions and format that I can send to the radio to perform the front panel operations. (I'd rather not "reverse-engineer" it.)

Forgive me if this topic has been covered, I've been away from this group for a while.
Please email responses. Thanks.

Dave

3242. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-11-18 20:38:50 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901118133850.20401f6e@HG.ULeth.CA>
Source record: 6302

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
November 17 to November 27, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 11 NOVEMBER TO 17 NOVEMBER.

Solar activity has been low to moderate over the past week. Several M-class flares were produced this week. Region 6361 produced produced two class M flares early this week. The first, rated an M2.1/SF, occurred at 04:36 UT on 11 November (location N10E18). The second, an impulsive class M1.6/SN flare, occurred at 04:45 UT on 13 November and lasted only a mere 7 minutes. Region 6361, which has now stabilized to a beta configuration, rotated beyond the western limb on 18 November.

A very potent and massive sunspot system has developed and is currently located (as of 18:00 UT on 18 November) at N19E15. This spot group is a huge 9,000 million square kilometers (5,625 million square miles) in size and encompasses a total of 78 sunspots. It's angular extent is 21 degree's. This potentially powerful sunspot group has a Beta-Gamma-Delta configuration (a magnetic configuration capable of spawning very powerful class X flares). This sunspot region is being monitored closely for signs of potential major flare developement. This region is capable of spawning a major class-X / 2B to 3B proton flare.

This region has spawned three class M flares over the past 24 hours, all three of which are suspected of producing SWF's (Short Wave Fades). The first, an M1.1/SN flare occurred at 18:48 UT on 17 November (location: N18E26). The second, an M2.4/SF occurred at 19:46 UT (location N21E18) and lasted for 54 minutes. The M-class flare was rated a class M1.1/1N, occurring at 22:45 UT (location: N15E28). In addition, Region 6368 also produced a class C8.8/2N flare at 17:45 UT. This flare began at 17:00 UT, and ended at 18:07 UT, lasting a total of 67 minutes.

Geomagnetic activity was mostly quiet through the early part of the week. Activity reached it's lowest level on 14/15 November. On 16 November, activity increased to active levels (with minor storming at high latitudes). A magnetic perturbation of 565 nanoteslas was observed at several high latitude observatories between 11 and 12 UT on 16 November. Most middle and low latitudes experienced only unsettled to active conditions. No significant storming occurred this week.

Auroral activity was not visible through the early part of the week, but increased rapidly to moderate levels over middle latitudes (and sporatic bursts of high levels over a few high-latitude stations) on 16 November. Activity decreased to low levels over middle latitudes on 17 November.

Radio propagation conditions were very good early in the week. However, conditions rapidly worsened on the evening of 16 November due to the increased auroral activity. Rapid signal flutter and fading was prevalent over most middle and high latitudes on 16 November. Conditions improved to near normal or slightly below normal on 17 November. Three noteworthy SWF's interfered with some daytime communications on 17 November, associated with the three M-class flares which occurred on that day from Region 6368.

SHORT TERM SOLAR TERRESTRIAL FORECAST

There is a risk for some major flaring to occur over the next 3 to 5 days (minimum) from Region 6368. The penumbral extent of this region is enormous. The magnetic complexity is clearly apparent, particularly in the trailer spot complex. This region will continue to spawn minor M-class flares over the next 3 to 5 days at least. The Space Environment Services Center estimates a 25% to 35% probability for a major class X flare occurring from this region over the next 3 days (day 3 = 20 November). In addition, estimated probabilities for major proton flaring is held at 15% to 25% over the next 3 days. The Space Environment Services Center has also issued a condition YELLOW alert status for potential PCA and proton event activity over the next 72 hours. This region is capable of producing some major activity. For more information, see the Potential Major Flare Warning which has been posted separately.

Geomagnetic activity is expected to rise to active levels again over the next 72 hours due to a fairly well positioned coronal hole. Minor storming may be possible at higher latitudes with the onset of this activity. Middle and low latitudes are expected to remain mostly unsettled with periods of active conditions. These forecasts exclude the potential for major flare-induced activity. Should a major flare occur, a potential impact analysis with revised forecast charts will be posted with the flare alert. Geomagnetic activity may also increase on 22/23 November when residual emissions from Region 6368 are expected to reach the earth.

Auroral activity is also expected to become more apparent over middle and high latitudes, particularly on 19/20 November when coronal hole induced conditions are expected to be most active on these dates at all latitudes. Activity should reach moderate levels at high latitudes with potential sporatic bursts of high activity becoming visible at several high-latitude locations. Middle latitudes will experience mostly low to moderate auroral activity. Low latitudes will not likely be able to witness any auroral activity this week, unless a major flare has a strong impact with the earth. Excluding potential major flare effects, the auroral zone will likely experience a slight southward shift, particularly on 19/20 November.

Radio signal propagation conditions are expected to be mostly normal over middle and low latitudes for the coming week. Degraded conditions may occur on 19-20 November due to coronal hole effects, although the worst conditions will likely remain confined to the high latitudes and northerly middle latitude

regions. Central and southern middle latitude regions may experience periods of strong auroral-induced signal flutter and fading on the evenings of 19/20 November due to increased auroral activity. However, propagation during the daylight hours should be mostly normal over most middle and low latitudes, excluding periods of SWF (discussed below).

There is a strong risk (60% to 80%) of SWF and SID occurrences on the sunlit hemisphere of the earth over the next 4 to 7 days due to minor and possibly major flare activity. SWF and SID durations could exceed 80 to 120 minutes. The risk for strong PCA activity is also evident due to Region 6368's threatening configuration. Users of polar and high latitude signal paths should be aware of the potential for possible radio blackout conditions over polar and high latitude regions, should a major flare occur. Likewise, users of satellites and satellite-propagation should be aware of the increased risk for satellite-level proton events and potentially strong major-flare induced ionospheric impacts.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 18 NOVEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6358	N14W93	145	0900	HAX	05	001	ALPHA
6361	N06W81	133	0360	DAO	07	005	BETA

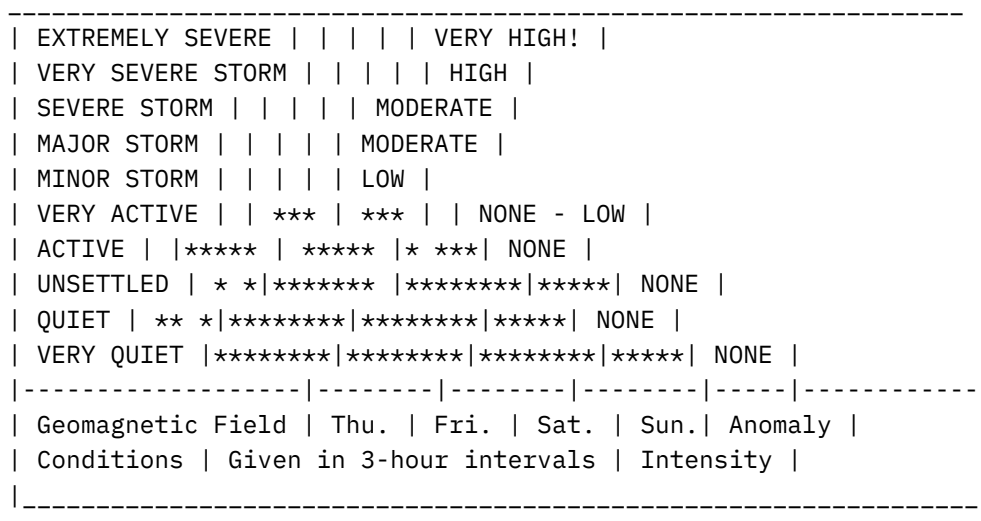
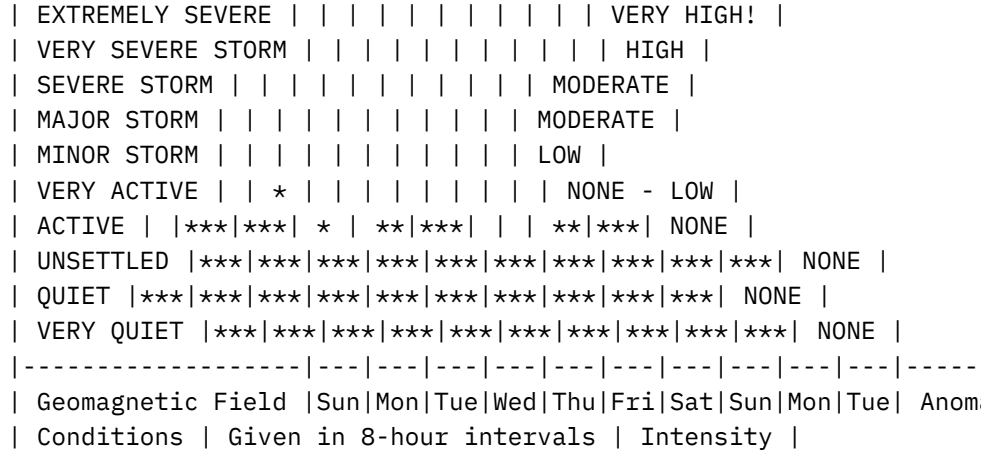
GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (18 NOVEMBER - 27 NOVEMBER)



```
|_____________________________________________________________________|

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena.
Transient energetic solar events cannot be predicted reliably over periods in
excess of several days. Hence, there may be some deviations from the
predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

Cumulative Graphical Analysis of
Solar Activity

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

=========
SpaceNews
=========

MONDAY NOVEMBER 19, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MARS VISIBILITY *
==================
The planet Mars will be visible to those living on the east coast of the
United States. The planet will appear as a reddish "star" in the eastern
sky. Best viewing will begin around 8:00PM local time. Mars will be
closest to Earth on Tuesday, when it will be about 48 million miles from
Earth. Viewing should be equally good through early December.

* SALYUT-7 NEWS *
=================
The presently unused and long abandoned Soviet space station 'Salyut-7' is
tumbling uncontrollably and is predicted to re-enter the Earth's atmosphere
in mid-January. Attempts to boost the 60 metric ton structure to a higher
orbit have failed. Salyut-7 should produce quite a spectacular light show
if it re-enters the atmosphere away from sunlight.

Here is element set 633 for Salyut-7 as released by NASA on 14-Nov-90:

Epoch : 90 318.01787657
Incli : 51.5983
RAAN : 257.2085
Eccn : 3.837E-04
ArgPer : 109.0767
MeanAn : 251.0680
MeanMo : 15.82804120
Decay : 1.11688E-03
Orbit # : 48841

* PACSAT NEWS *
===============
Work continues on UO-14 and AO-16. DOVE-1 will be reset shortly after
software testing on the other Microsats is complete.
```

* RS-14/RUDAK-2 NEWS *
======================
Reliable sources within the Soviet Union indicate that the launch of RS-14/
RUDAK-2 is now expected to happen on or about November 24, 1990. UA3CR
requests the help of radio amateurs all over the world to collect telemetry
and send it via packet radio or via a SSB net to him. The first day's worth
of telemetry will transmitted via a CW beacon at 20 WPM on 145.822 or on
145.948 MHz SSB and will be vitally important to ground controllers. Later,
after ALL systems are working properly on the RUDAK-2 transponder,
PSK/BBS/MODE B operations will begin.

Source record: 6305

After six months of "read-only" privleges for this newsgroup I've finally
been granted post priveleges. The following is six months of bottled up
questions for the ham-radio gods out there.

1) about Yeasu FT-736R's: is there a modification that will allow
this radio to receive weather-satellite downlinks on 137.xxx
mHz? The specs say that it has a 50kHz IF bandwidth, so I
should be able to copy the signals without too many problems
if I could only get it to rx that low.
2) about az-el rotors: we have the Yeasu GB-5400 az-el rotors
swinging 3 KLM beams (2meter, 70cm, and 24cm). We also have
a 386 machine. The logical question for a EE major is: How can
I control the rotors using the computer? I have some ideas that
would involve a game card and a parallel printer interface,
but I'd like to tap the net's collective intelligence on this.
3) about IC-781's and IC-4KL's:
a) has anyone had any success using the built in data display
for rtty work? Can I use a TNC (esp. an MFJ-1278) or
can I build a dedicated-RTTY device that takes that output
from the data jack, decodes it, and feeds it strait back in.
Anyone have any experience with this?
b) I've made the 10m conversion to the IC-4KL, but it doesn't have
"28" light on the remote controller so the average idiot in
the station can't tell that the linear is ready for 10 meters.
Does Icom sell an upgrade that allows for this?
Item of Note: After playing with the '781 for about a month, I'll
concede that it's a hell of a radio, but it's not much better than a
TS-440 with the external station monitor and a palomar pre-amp...
4) about TNCs: Is the MFJ-1278 suitable for receiving APT format
weather satellite downlinks (re: question #1)? What software/
additional hardware do I need to get weather pics?
I have a Kantronics TNC-2 with rom update 2.83 (dated 1988). Is
there a new version of the ROM, and is it worth the update? BTW,
I tried running packet on my FT-470 but the TNC throws off so much
RF that it desenses the radio to the point that it's worthless. My
ancient (!) IC-2AT does a great job of it though. I still think
the 470 is the neatest handheld on the market.
Since we have satellite capability in the station, what PSK modem is
the best? Is there one that we can piggy-back on an existing TNC,
esp MFJ 1278 or TNC-2?

I guess that about covers it. We are trying to automate as much of the station
as possible, so any tips or hints concerning computerized control of radios,
antennas, TNCs, etc. is greatly appreciated.

3246. Re: Mobile HF antennas

Newsgroup: rec.ham-radio
Date: 1990-11-18 22:21:28 UTC
From: alan@km4ba.UUCP
Message-ID: <194@km4ba.UUCP>
Source record: 6306

You are correct about the bumper mount being useless.

The solution I used on a landcruiser wagon, was to put
a marine rachet mount on the roof. On the interstate, I ran
with the antenna straight up. In town I ran at 45 deg, and
I could lay it flat when I was not using it.

It out preformed the same antenna mounted on a fender, and
the bumper mount was useless, even when on the front.

An interesting side effect was that with the antenna at
45 deg, it still worked ok. I think most hf whips will
"lay down" quit a bit, unless you guy them. By running at
45 deg, it tended to sway less.

I saw a neat design on a full sized van at Dayton. The
owner claimed it worked as well as anything else he had
tried.

I will try to dupe:

```
|
| | |
| | | |
| | I I
I I I I
Alum. Angle I I I I <- hustler
-> _____________________________________ resonators
feed pt-> | i i <- insulators
-------------------------------------------------------------
^ Van roof
```

I can see how this would not be to different from a
laid over hustler with a "spyder"

I have switched from hustler to monoband 8' fiberglass
whips. The ones I use are one piece, and work ok. (I think
the hustler may radiate better.) The reason I switched is
I can use the fiberglass ones without a spring, and still
drive in the woods. I have bayonet mounts, and can change
whips quickly. I still wonder if a stainless whip, with a
base mounted auto antenna matcher is not the best way.

Not using a spring allows the antenna to stay erect at speed,
and keeps the swr from varying. This offsets the slight
advantage the hustler has. The hustlers do seem to have
slightly higher bandwidth.

If you drive around much with hustlers on, you will break some resonators. Springs help some, but you will still hit things, and at speed, the springs do little. The fiberglass helicals are pretty rugged.

There is a green book out called "35 yrs of HF mobile", or something like that, which has lots of good info.

I have quit playing very much mobile, except on trips, but still keep the radio in the 4wd. I carry a dipole, and coax. You will find that same conditions, it can make a 20db difference vs your mobile antenna, even cross polarized.

Oh well... just my experiences...

3247. ICOM IC-32AT's & IC-24AT's Mods Available?

Newsgroup: rec.ham-radio
Date: 1990-11-19 00:26:41 UTC
From: domae@heat.nrtc.northrop.com
Message-ID: <13129@gremlin.nrtc.northrop.com>
Source record: 6307

At the moment, I'm contemplating purchasing one of these two radios,
but I'd like to know what modifications are available for them.
I suppose I'm really interested in knowing what mods are available, how
extensive the mods are, and how well the mods work.

What kinds of extended receive ranges are there?

Are there any after-market accessories like a DTMF pager?

Thanks for any comments,

Terry Domae
Northrop Research and Technology Center

3248. Schedule update: rec.ham-radio.legal proposal

Newsgroup: rec.ham-radio
Date: 1990-11-19 02:19:25 UTC
From: jmaynard@thesis1.hsch.utexas.edu
Message-ID: <4331@lib.tmc.edu>
Source record: 6308

I'm going to slow down the schedule for the rec.ham-radio proposal slightly, due to the realities of the moderation process for news.announce.newgroups, which is the official place for the formalities of the newsgroup creation process, and the fact that this is Thanksgiving week in the US. Since the moderator only posts messages weekly on Sunday night, and will only guarantee to post things he gets by Friday evening, I'll post the formal Call for Discussion at 5 pm Friday, 30 November if there's support for the idea. This will make the discussion run from Monday, 3 December through Monday, 31 December, and a 21-day voting period run from 31 December until 20 January. I agree this isn't the best schedule, but the Guidelines for Newsgroup Creation (available at a news.announce.newusers near you) specify these as the minimum lengths of time for each phase of the process. (Fun, fun!)

If you missed the original posting, rec.ham-radio.legal is intended to be the place for the interminable discussions that crop up here about rules and regulations, both existing and proposed. Recent topics that generated lots of flamage, such as out-of-band mods for radios, pizza on the autopatch, and HTs on airliners, as well as the ever-[un]popular code/nocode war, are the kinds of things that rec.ham-radio.legal will contain. It's apparent to anyone who's been reading this group for any length of time that those kinds of topics aren't going away, so this is an attempt to make it easier for those who have grown sick of the whole business to ignore it, without having to ignore everything posted by given authors (as the kill file posted here recently does).

Nick Sayer suggested a Frequently Asked Questions/Arguments posting for the group. I think this is a good idea, and would like to see it; unless someone else has a burning desire to generate one, I'll probably tackle it myself, but it'll have to wait until after Thanksgiving. I'll gladly accept help on this one, too.

3249. Glen Hauser to move to WWCR! (Listening Tip)

Newsgroup: rec.ham-radio
Date: 1990-11-19 02:42:52 UTC
From: flash@lopez.UUCP
Message-ID: <1990Nov19.024252.4273@lopez.UUCP>
Source record: 6309
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen Hauser will be heard on WWCR, The powerhouse international broadcaster, beginning Sunday 25 November 1990. His broadcasts will then be aired regularly thereafter. Convieniently scheduled for 8:30pm Eastern Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have all the impirical evidence he needs. And if they don't... Well we

won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

RNI and its rotating schedule

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very regular schedule. Unfortunately, the best program host (Johnny Lightning) is heard only once a week. My own personal LEAST-favorite (Pirate Joe) is heard twice a month (or more depending on the month) Now if you are a lefty liberal 1960's anti war-save the wales-peacenick who gets into those old vietnam era protest songs and mindset, YOUR mileage might vary. I prefer irreverance and biting satire, ala Johnny Lightning to the predictable Pirate Joe. Other shows include "A different kind of oldies show" which is not all that different a kind of oldies show, really... AND the Steele Ship (host Randi Steele), who is in a similar mold to pirate joe, but not quite as bad. So far, the WORST RNI program was Pirate Joe broadcasting a distorted recording of the ANTI WAR rally which took place in NYC in protest of the Desert Shield Situation. Joe must be in his glory with another war to protest. EVERYONE I know who listens to RNI flipped the station off after the program got interminable. I bet even the most loyal RNI listeners just could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT NIGHT?

That's all of my time.

Thank you for Yours.

DX-PEDITIONS A PLENTY (Pt 1)

HR AMSAT NEWS SERVICE BULLETIN 321.01 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Island DX-peditions should keep Satellite DXers busy

With some indispensable help from Gary Garriott, WA9FMQ, Eric Rosenberg WD3Q has been granted a reciprocal license in the Dominican Republic and will be operating as WD3Q/HI3 from Saturday, 24 November to Thursday 30 November from Puerto Plata on the north coast of the country. He expects to be on AO-13 mode J and B every day, but as this is a family holiday, one never knows whether this will actually be the case!! He is planning to be active on Thanksgiving weekend, and hopes to check into the Operations Net (145.950 MHz) on Saturday morning.

The equipment comes from Mike Crisler, N4IFD (antennas, amplifiers, preamps, feedlines, et al), and Art Feller, KB4ZJ (FT-726R radio). Mike has designed a portable mast, tripod and antenna mounting system for the small KLM twin antennas that fits in a 7 foot x 6 inch PVC pipe. Eric plans to take as many pictures as possible and will publish an article for a future issue of AMSAT Satellite Journal.

The windows for this operation are tentatively scheduled as follows:

SAT 24-NOV-1990 1400 to 1900
SUN 25-NOV-1990 1300 1800
MON 26-NOV-1990 1100 1630
TUE 27-NOV-1990 1000 1500 <--
WED 28-NOV-1990 0900 1330 | He may not start until 1100 UTC or so
THU 29-NOV-1990 0730 1230 <--

All dates and time are in UTC.

Those fortunate enough to work Eric can QSL to his home address of:

RS-14/RUDAK-2 LAUNCH UPDATE

HR AMSAT NEWS SERVICE BULLETIN 321.03 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Revised RS-14/RUDKAK-2 Launch Set For November 29, 1990 +- 1 Day

AMSAT-DL officials have been informed that the launch of RS-14/RUDAK-2 will occur on or about November 29, 1990, plus or minus one day. Also, it is not expected that the RUDAK-2 transponder will be turned on until three days after launch. Radio amateurs should not expect to hear the CW beacon from RUDAK-2 until December 1, 1990. Efforts are still under way to provide a launch net on 20M starting about an hour before launch. UA3CR requests the help of radio amateurs worldwide to help collect telemetry and send it to him via packet radio to him once the CW beacon is turned on. The CW telemetry beacon can be heard on a downlink frequency of 145.822 or 145.948 MHz SSB. At this time the exact launch window has not been announced, nor have the preliminary Keplerian elements published. Please stay tuned to AMSAT Nets and AMSAT News Service (ANS) bulletins for late breaking news concerning the launch of this exciting new OSCAR.

[ANS would like to thank DB2OS for providing the information in this bulletin.]

SB ALL @ AMSAT $ANS-321.04
WO-18 STATUS

HR AMSAT NEWS SERVICE BULLETIN 321.04 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Efforts To Understand WO-18 Attitude Continue; New Picture Software Uploaded

Ground controllers at Weber State University (WSU) are continuing their efforts to analyze the attitude behavior of WEBERSAT-OSCAR-18 (WO-18). They have observed over the past several months that WO-18's Z-axis spin rate has been slowly decreasing. In an effort to understand this phenomenon, the students in the Computer Science Department are building a database to store the past ten months of real-time telemetry and Whole Orbit Data (WOD) collection. This will allow engineers to retrieve data and plot telemetry parameters quickly for analysis. Storing this much data immediately presents a significant challenge in view of the enormous volumes of data involved, however, ground controllers will have valuable tool in order to characterize spacecraft motion and health.

To cope with the slowing of the spin rate of WO-18 and to enhance picture tak-
ing, new on-board software has been uploaded to WO-18. This imaging software has the added "smarts" to look at the solar array (S/A) currents, wait for a specified S/A current, and then snap a picture. By using solar array currents, WSU engineers will use this information to predict when the CCD camera is earth pointing and thus produce better pictures.

In the upcoming weeks, new software will also be loaded to include the CCD Light Spectrometer data in the telemetry. The spectrometer is designed to measure the spectrum of sunlight reflected from the earth's atmosphere. This will provide scientist with the composition of the atmosphere at specific places and times.

Radio amateurs who wish to process WO-18 images can obtain more information about WEBERWARE 1.0 from the AMSAT Software Exchange at AMSAT-NA HQ's.

SB ALL @ AMSAT $ANS-321.05
MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 321.05 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Engineering Team reports on current status of Microsats

Beta testing of the new PACSAT BBS software uncovered a minor bug which could only be discovered while the bird was being used by multiple stations. After analysis of a memory dump from AO-16, the failure mode was discovered and was reproduced on a ground-based Microsat simulator. The problem was fixed and AO-16 was scheduled to be reloaded with the new code during the weekend of 17 November 90.

The AMSAT Microsat Engineering team has generated the following update on all the Microsats dated 16 November 90:

AO-16

AO-16 is currently running the basic command and telemetry system, without the Whole Orbit Data (WOD) routines. This is in preparation for a full reload this weekend with an updated operating system. Fixes include various improvements in memory utilization, making more memory available to application programs.

This operating system will support the first production version of the file server software, loading will start this weekend. The new version will support the full 8 megabyte file system.

DO-17

No Changes. Uploading of new software is planned for December.

WO-18

The version 3.0 imaging software was unloaded 11/13/90. The 3.5 version was loaded 11/14/90. This version uses the arrays currents as well as the horizon sensors in the attitude determination algorithm. A variable timer has been added in order to allow a longer time for constraints to be met before an image capture is triggered.

LO-19

No Changes. Uploading of the pacsat file server is planned for late November.

AMSAT Argentina Satellite Symposium Proceedings Published
During the weekend of 22 September 90, AMSAT-Argentina held a Satellite Symposium in Buenos Aires, Argentina. ANS has be informed that the Proceedings of that meeting have been published and are now available.

The Proceedings total approximately 90 pages and based on the index of papers included (13 in all) and because the Symposium was held in Argentina, one can assume that the Proceedings are published in Spanish. For more information on these papers, contact:

Carlos Calvo 1424, 1er Piso, Capital Fed.

TE: 32 0555, 26 0505.
P.O.Box 9, Suc.1, 1401 Buenos Aires. Argentina.

He can be contacted at: LW2DQO @ LU7AA.

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 321.07 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

Fall Edition of ZRO Test Announced

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule through the end of 1990 via AMSAT-OSCAR-13. This activity is a test of operating skill and equipment performance tested by copying signals decreasing in strength in predefined steps. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero". The control operator will send and repeat a random five-digit number, then lower uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine"). A participating listener monitors the downlink signals till they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9). This then results in the need for less uplink power for routine communications operation.

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday November 24, 1990 at 1700 UTC "B"
Saturday December 1, 1990 at 2030 UTC "B"
Saturday December 15, 1990 at 1630 UTC "B"
Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!
/EX
SB ALL @ AMSAT $ANS-321.08
OPERATIONS NET SCHEDULE
HR AMSAT NEWS SERVICE BULLETIN 321.08 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.
Mode B nets are conducted on an AO-13 downlink frequency of 145.950.
Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

24 Nov 90 97 J/L 1430 WD0E N5BF Saturday
02 Dec 90 63 B 1530 WB6LLO WA5ZIB Sunday
08 Dec 90 156 B 1300 WB9ANQ KA5SMA Saturday
15 Dec 90 97 J/L 1400 N5BF WD0E Saturday

STS-37 astronaut Jay Apt (N5QWL) will be the featured guest on the 24 November 90 net. Jay will be discussing late plans for his own flight, which is to be flown next spring, and STS-35, which is scheduled for early December. This round table-interview session with N5QWL promises to be very interesting.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-321.09
FALL AO-13 TRANSPONDER SCHED

HR AMSAT NEWS SERVICE BULLETIN 321.09 FROM AMSAT HQ
SILVER SPRING, MD NOVEMBER 17, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140 <--- QRP on Mode B Please
Mode-B : MA 140 to MA 256
Omnis : MA 220 to MA 040

This schedule is expected to continue through 26 Dec 90.

The command team requests that you make a specific effort to use QRP on Mode B between MA 135 to 140. This is specifically to help those people experimenting with Mode S. (Although you really should always keep checking that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:
BLON = 179.1 and BLAT = -1.5 for 19 November 90

AMSAT-OSCAR-10 has come out of hibernation and appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately.
/EX

3252. Kenwood 1 yr warranty on all equip. retroactive Oct 1,90

Newsgroup: rec.ham-radio
Date: 1990-11-19 10:37:45 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Nov19.103745.29715@midway.uchicago.edu>
Source record: 6312

Caught this item in 73 mag. thought people would be interested...

Kenwood now has a new warranty program...

Effective Oct 1,1990 all new Kenwood transceiversm recievers, accessories,
and options carry a full one-year warranty from the date of purchase.

New boxed quipment that has been on the shelf for a while may still have
the old "90 day" warranty card. But, all you seem to need is a dated
reciept showing that the equipment was purchased on or after Oct 1,90.

Also, my strategy has been to charge my "large" purchases on a VISA that
offers the "extended warranty program". Some VISA and American Express
will double manufacturers warranty up to a year. So, now your new
Kenwood stuff could potentially have a 2 yr warranty.

Please read the fine print on your VISA extended warranty agreements.
Some require that you "register" these purchases within 30 days to
take advantage of extended plan.

Gary

Well, I'm not convinced that it has no relevance to amateur TV and/or Novice training tapes, but in any event my question has been answered, and I'm grateful to all who offered suggestions.

Thanks for the info, Bob.

I must tender my most humble apologies to the ARRL. Your note was published in QST.

I'm somewhat disappointed that the various reviewers of equipment have not covered this aspect of some pieces of equipment. The RADCOM reviews combine a set of thorough measurements of the equipment's performance - compared with its specifications with a description of its use. There is no opinion of the design of the equipment, or of its life expectancy given. The UK commercial ham-radio press usually performs few or no measurements and content themselves with quoting the specifications and describing its use.

The RSGB creates the impression that it is guarding its advertising revenue by always seeming to recommend the equipment- you have to read carefully to find out what for !

Calls for an investigation into the pricing of equipment have been stone-walled over the years. G's pay roughly 1000 pounds sterling for a rig with <$1000 US price. With $1.90 ish exchange rates, some people want to know who's getting rich :-)

PS Readers of the ARRL subs increase string may be interested in the last copy of RADCOM which contained the announcement of an increase in RSGB subscriptions to 30 POUNDS (about $57) :-

_ never expected a reply from the source of that small but important note

amazed GM4ZNX !

3255. New World of Radio Source

Newsgroup: rec.ham-radio
Date: 1990-11-19 14:13:00 UTC
From: asa@STL-08SIMA.ARMY.MIL
Message-ID: <9011191411.AA00422@ucsd.edu>
Source record: 6315

There will be a new source for Glenn Hauser's "World of Radio" program, beginning next weekend (Nov. 25-26, 1990):

WWCR, Nashville, TN on 7520 kHz, UTC Mondays at 0130 (That is 7:30 PM Central Time).

This should offer an improved signal compared with the problems that have been affecting WRNO in recent months. (Does anyone know the source of that fax [?] transmission that is constantly interfering with WRNO on 7355 kHz? Would someone blow up that interfering transmitter, please? :-)

Glenn hopes that another broadcast can be added on WWCR during the day, when it is on 15690 kHz, but there is nothing definite yet on that.

By the way, due to some strange mailer situation, I have not received any SWL or ham list mail for some days now. I think this message will get out to the lists OK, though. But I may not see any followups until the list mail starts flowing in here again.

Regards, Will Martin

Me, too, but what good is it if everyone does multiple posts? With RARE exceptions the only time I post an article in two or more newsgroups is in reply to someone else who did (and I'm therefore uncertain which one he's actually reading). But some people do it habitually. That would tend to defeat the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more descriptive.

A good book on the math behind what Brian has described is "Signals and Systems", by Oppenheim and Willsky. Prentice Hall. If you really want your mind bent "Digital Signal Processing", by Oppenheim and Schafer, Prentice Hall, has been the basic text for the past decade. There are newer texts out today and

they are coming out faster now that the field is heating up. Be prepared for some heavy math-o-matiks if you get into the theory but as hardware comes on line cookbook solutions for the Amateur will become more available.

But of course! 'Stranded in Iowa', by Manfred Mann('s Earth Band). I do not know which album that this track is on. It was a fairly popular request on the local rock FM plant in Des Moines while I was at Ames attending Iowa State. I had heard it played in Illinois sometime in the late 70's, so that gives you some idea of the vintage.

I have no idea what the story is on this track, whether the group had an ugly lay-over in Iowa, or just through a dart on the map. I have even less insight as to why it has the morse and radio sounds. Perhaps someone with the album would have some background.

Interesting to have that tidbit dredged up from the past.

I posted something a while back about the sexist wording on the WAZ certificates, and said that I would write to the current award manager, K1MEM. I just had a letter from him, and he says that when the current stock of certificates is used, they will be re-wording the next batch.

I was disappointed that my posting had such a negative reception here. Most of the responses were "his includes his and hers", "how trivial" and so on. The point I was trying to make was a deeper one than the wording on a particular certificate. We have people on the net who insist that we need to increase the number of hams by a large factor, and yet most of the current hams seem to have this pro-male attitude about the hobby. Without changing the current licensing structure, we would roughly double the number of hams if we recruited one female ham for each male. I never have to use male-only parts of my anatomy to operate the radio on any mode (experiences to the contrary should be sent to rec.sex or wherever), and don't understand why there aren't more female hams (well, I do, it's connected with the "girls can't and shouldn't do technical things, they should stay at home sewing" attitude that is still with us). So perhaps the responses to the posting were what I should have expected. I think it's a pretty sad situation.

> whole contracption is then suctioned to the bus window.

I constructed a 1/4 wave 2m antenna from a cheap TV dipole. I used the
type that comes with the TV, the type that attaches to the back of the TV.
The whips are telescoping, and can be swiveled 180 degrees. I removed the
300 ohm twin-lead, and mounted a BNC connector directly to the mounting
screws for the two whips. I carry a 6 foot length of RG-58 with BNC
at both ends. I have attached a 19 inch length of fishing line to the base.
I use this for measuring the length of the extended whips. I use clear
plastic suction cups to attach the whole thing to a window. Only 2 suction
cups will do just fine.

3266. Re: 8mm. camcorders

Newsgroup: rec.ham-radio
Date: 1990-11-19 21:14:52 UTC
From: ray@cs.rochester.edu
Message-ID: <1990Nov19.211452.171@cs.rochester.edu>
Source record: 6326
Cross-posted to: rec.radio.shortwave,rec.ham-radio.swap,rec.ham-radio.packet,rec.ham-radio

Some other drawbacks are shorter recording time for the 8mm camcorders due to the smaller tapes.
Also, if you want to play 8mm tapes back through your VCR using VHS tapes, you must record the 8mm onto VHS tapes. This naturally reduces the quality of the final playback due to the addition of noise.
I think the rule of thumb is that every cope of a copy will have twice the noise in it so that a copy of the orginal will have twice the noise of the orginal making it look much grainer or fuzzy.

3267. Prescaler chip info needed

Newsgroup: rec.ham-radio
Date: 1990-11-19 21:16:23 UTC
From: andyw@aspen32.cray.com
Message-ID: <150427.11506@timbuk.cray.com>
Source record: 6427

On behalf of myself and Mike, WA0VNH, I'd like to request some info.

We're both looking for info and/or mailorder source(s) for a divide by
10 prescaler chip which will work up to 500MHz. Mike believes the Fairchild
11C90 will do the job, but we don't have a source for it.

If anyone has a better chip suggestion, some technical data, or a mailorder
source for such components - we'd be glad to hear of it.

Thanks in advance.
(I will summarise to the net, if anyone expresses an interest).

>
>--
>B. Douglas Reeves (N6XHW) D_Reeves@oxy.edu (Internet, of course!)
>147.705/445.450 in So Cal 1600 Campus Rd., La, Ca, 90041 (USnail)
>"Cogito, ergo es." Occidental College Computer Networking

The answer is *yes*!
The TH-75 is modifyable in both TX and RX for extended frequency coverage on
both 2m and 440. The receive coverage appears to be for the entire bands ie
136-175 and 315-512 (I don't have my radio on hand to say exactly). This
extended RX is obtained by cutting the jumper wire on the control unit.
The extended TX mod requires the removal of a diode. I figured this out from
the schematic and I only know that it works. It may not be the *correct* way.

After any mods, reset the microprocessor (after writing down the info in the
memories). I find that the HT seems to go into mad fits of beeping which
disappear if I turn it off, then on. This happens only rarely and is
probably a defect not a side effect of a mod.
Incidentally, I don't know how well the radio performs at the ends of the
respective bands. The PLL appears to have some difficulty locking up there
ie: band scan appears to be slowed.

The PLL would probably have to be readjusted for coverage above 455 MHz
since the PLL seems to be aligned for the lower portion of the band.

I don't know what use you have for the mods. I did it partly as a curiosity,
and partly because the ham band is bigger than the TX/RX capabilities of the
HT as sold. I haven't found any FM activity on 420-440 MHz, by the way.

The mods are deducible from the manual. Just look closely at the table of
which diodes are in and out for which models.
Feel free to contact me, provided you don't plan to do anthing beyond the law.
(In which case, don't do anything *too* naughty and leave me out of it)

Incidentally, it seems that most HTs are modifyable without much difficulty.
Hope I answered your questions.

3269. ICOM Batteries (memory)

Newsgroup: rec.ham-radio
Date: 1990-11-19 21:34:55 UTC
From: tad@ssc.UUCP
Message-ID: <552@ssc.UUCP>
Source record: 6429

There have been several postings on here lately about the battery
in some ICOM HF radios that holds memory. Some folks fear that the
battery will wear out in a few years, and they sill be stuck with a
microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries
in ICOM radios (I'm NOT talking about the battery that POWERS your HT!)
have a predicted life of over 15 years. If you want to replace yours
before it runs out, and are afraid of losing memory, float a power supply
across the battery that is set at about the same voltage as the battery.
Then remove the battery, and replace it. Keeping voltage on it will
keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they
will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is
76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple
of variations of domain addresses could help if you want a reply.

Hello hammers,
(PLESE E-MAIL ANY RESPONSES I DO NOT GET THIS GROUP/LIST, THANKS)
Are any of you out there also into Citizen's Band? If so, what can you tell
me about good (car) brands, what type of antenna to use, how much I sacrafice
going with a coiled 4ft vs a straight (108?)" antenna, how many users are
there really on the roads, etc, etc, etc.
Thanks for your help,

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper messages. As long as we make a good faith effort to comply, the FCC won't nitpick if an occasional clinker slips through.

3274. more on the WAZ award

Newsgroup: rec.ham-radio
Date: 1990-11-19 23:29:02 UTC
From: oo7@ut-emx.uucp
Message-ID: <39972@ut-emx.uucp>
Source record: 6434

In the previous posting I forgot to mention something the WAZ award manager (K1MEM) told me. I asked him why the WAZ-SSB awards are numbered sequentially, while there is no such numbering scheme for the WAZ-CW ones, which are numbered along with the WAZ-mixed ones. That is, if you do a WAZ entirely on CW, you get the same certificate as for a mixed-mode award except that it has "CW" in ink at the bottom. There are historical reasons for this (going back a *long* way). The news is that they are just about to start an all-CW WAZ series. Read the footnote on page 50 of the Nov CQ Mag for more information (basically, you make QSOs starting Jan 1991, and the QSL cards must say "two-way CW"). There are some other changes to the WAZ program that are listed in that article.

Incidentally, to those of you who want to fragment wreck.ham-radio even further, where would the above posting go, in your view? It mentions the dreaded CW, even advocates its use on the ham bands - does that mean it belongs in whatever.legal? Do Phil Karn's quantitative comparisons of the various communication modes belong there too? What about those of you who are disturbed by mention of contests, DXing and so on? How about all those articles about what sort of antenna to use in various circumstances? We are not all interested in all the postings that appear here. I find it very easy to skim all the articles in r.h.-r. and I suggest that if we need another subgroup or groups then this one should be renamed ham.radio-ostrich, for all those who would like the group to be like a nice pleasant tea party with no disturbances to their own set way of doing things. Or rec.ham.75m?

Wadda ya do when...

You call CQ (cw mode) and station XYZ answers - absolutely gorgeous signal. You finish the first exchange, having told him he's RST 599 plus 20 into Timbucktwo and then send it back to him KN.

Now XYZ comes back for his/her first exchange. After the first couple of words or so you soon realize that this is not gonna be one of those "vy fb qso's" cuz XWZ's fist is obviously afflicted with both a lisp and a stutter and you'll have learned an entirely different version of morse by the time this qso ends :-)

So... I'd like to poll the net and request responses which answer the question - "How do I tactifully get out of this mess without pissing this guy off?"

Of course as the originator of this posting I get the obvious one which goes something like... sri om but the QRM es QRN are murder on this end...

73...

3276. Here are the Kenwood TH-77A mods!

Newsgroup: rec.ham-radio
Date: 1990-11-19 23:46:55 UTC
From: gwalsh@kilroy.jpl.nasa.gov
Message-ID: <1990Nov19.234655.7052@elroy.jpl.nasa.gov>
Source record: 6436

Here is the complete list of mods that are know to date for the
Kenwood TH-77A Dual Band hand held:

From the factory, it can receive 138-174MHz and seems to do it quite
well with the supplied rubber duck antenna. It also can receive
438-450MHz and, likewise, does this quite well too! One very interesting
feature of the TH77A is that it can do *DUAL* UHF receive! To do this
it uses the VHF receive section and you have less sensitivity, but I
really haven't noticed much signal degredation at all.

Kenwood has made this radio compatible with the new ICOM S-Series radios
from what I can tell. It has DTSS (Dual Tone Squelch System) which means
that your radio will not break squelch until it hears a particular
sequence of three DTMF tones (ICOM has this also and they call it
Coded Squelch which also use three tones). The TH77A also has a paging
function that works *exactly* like the ICOM paging. You program the
radio with a personal 3 digit DTMF code and someone pages you by
transmitting YOUR 3 digit code, followed by a * character and then
their own 3 digit code. The ICOM will start to ring to let you know
that you have been paged and display the 3 digit code of the person
that has paged you. The TH77A will beep once and open squelch as
long as the person that paged you does not drop carrier (I prefer
the ICOM method for this part, but there is a work around that I
will mention in a bit). One thing the TH77A does at this point is
bring up a timer so you know how long its been since you've been
paged. Maximum time is 99 hours and 99 minutes. Let's see if your
battery can hold out that long! The workaround so the TH77A will
ring, rather than just beep and open squelch is to put the radio
in the pager mode AND also put it in Tone Alert. When you get
paged... the radio will "beep beep (pause) beep beep" five times
and start up the timer. Kenwood has provided two different types
of BEEPS for you. The second type is to ring like an electronic
telephone. This one *REALLY* sounds nice!! For those of you that
like autodial memories, there are 10 memories that can store 15
characters each. There are 40 regular frequency memories in this
radio and you can make them all UHF if you like (no restriction).

NOW! On to the *EXTRA* capabilities (there are other BASIC functions
that I didn't mention, those were just the highlights).

After making a few modifications to this radio, you can get it to
do the regular stuff that the IC24AT will do, such as AM aircraft,
expanded UHF (400-512 depending on PLL lock) and 800-950 (again,
depending on PLL lock) in addition to cross band repeat.

HOW DO YOU DO THIS!?

Easy (if you've got a steady had for removing a chip resistor!).

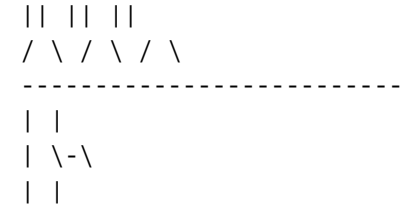
Open it up. There are 3 screws visible on the outside and 4 more
underneath the battery pack. Unlike most radios, this one doesn't
have a spring for the battery release switch. It gets spring
action from the metal plate that you will remove when you take
out the four screws. I love it!

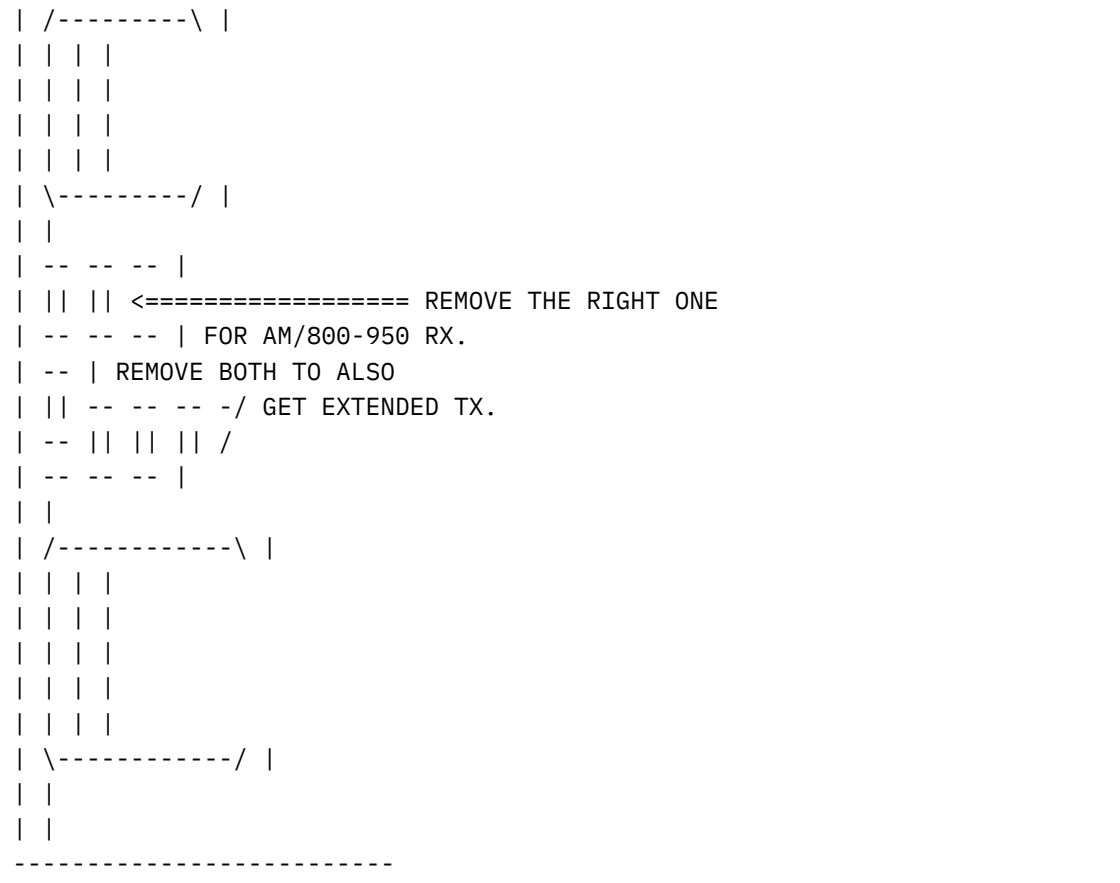
Anyway, the area you will be working in is on the control board
which is fixed to the front section of the radio. In particular,
look for the yellow electrolytic capacitor (its yellow in mine) that
is at the dead center of the board (there are two IC's, one above
this and 1 below this). You will have to remove the electrolytic
capacitor (C124) and set it aside for a few minutes. You will be
putting it back afterward. The reason for removing this is so that
you can remove a chip resistor that is underneath it. To avoid tearing
the flex board foil traces, do not bend the leads of the capacitor.
There is a green wire that is connected to one side of this capacitor.
If you disconnect one side of this green wire, you will get RX from
400-512 (PLL lock depends on the radio, but you can DIAL from 400 to
512). Orient the radio so that the volume controls and BNC are at
12 O'Clock on your table (farthest from you) and the bottom (where the
battery connects) is at 6 O'Clock (nearest you). In the area where you
removed the capacitor, you will see a blank space where there could have
been a chip resistor followed by two chip resistors side-by-side and in
the next row below that, you will see 3 more that are side-by-side.
There is one to the left of these two rows that is kind of off center.
Now, there are three ways to configure this radio at this point:

1 - With one side of the green wire pulled, you will have
136-174 RX, 400-512 RX. If that's all you want, you are done.
2 - By removing the rightmost chip resistor (R129), in
addition to keeping one side of the green wire disconnected,
you will have 136-174 RX, 400-512 RX, 118-136 AM RX, 800-950 RX.
3 - By removing both of the chip resistors, in addition
to putting the green wire BACK where it belongs, you
will have 136-174 RX/TX, 400-512 RX/TX, 118-136 AM RX
and 800-950 RX.

All three of these options include, of course, putting the electrolytic
capacitor back in place afterwards.

NOTE! ONCE YOU START DOING THIS STUFF, YOUR MEMORIES AND POWER ON SWITCH
CONFIGURATIONS WILL ALL BE LOST! MAKE A NOTE OF HOW YOU ARE SETUP BEFORE
YOU BEGIN!





Layout shown with electrolytic capacitor C124 removed

The best way to do this is to heat up both sides of the resistor and push it out of the way with something small. At least this was the best way for me! Once it's out, put the capacitor back in place and close it up. (Put the green wire back also, if you are making the out of band TX mod too!)

TO OPERATE THE NEW FEATURES

To receive AM aircraft, get the VHF side in the main band and hit the ENT key twice to go to the VFO. Once you are in the VFO, hit the UxU key twice. Once for dual UHF receive and the 2nd time for AM (118-136).

To receive 800-950, get the UHF side in the main band and hit the ENT key twice to go to the VFO. Once you are in the VFO, hit the UxU key once.

To enable crossband repeat, hold down the SUB BAND UP ARROW key while turning on power. To disable, do the same thing again. Kenwood says that both bands can contain shift information but only one band can include an encode/decode tone.

One more thing. The POWER ON + 8 KEY that allows you to select the kind of memory recall will be a bit different. Now, you will have an

extra option in the right side of the display. E1 or E2 which may
be selected with the VFO control on the top of the radio. E1 mode will allow
you to automatically make the radio switch to AM or switch to the 800MHz
stuff as you use the VFO knob to move through your memory channels. E2 mode
will skip over any memories that are AM or 800-950MHz. In E2, the only way
to recall one of the *special* memories is to go to the VFO, hit the UxU
key to go to AM or 800MHz and then recall one of these memories. Personally,
I have mine in E1 and don't know any reason why anyone would want to be in E2,
but its there if you need it!

The Kenwood modification sheet says the following about AM sensitivity:

While the receiver sensitivity is neither specified nor guaranteed
for the AM range, the sensitivity is typically less than 1uV for
10dB signal plus noise to noise ratio between 123-131MHz. The
band edges, however, measure between 8-20uV for 1dB S+N/N ratio.

SOME PERSONAL OBSERVATIONS

My radio seems to have a hole in it in the 800MHz band. I get this beeping
sound when I try tuning between 864-875MHz (I believe the TH77A beeps
when it can't lock). Also, the sensitivity could be better around 483MHz
(local Sheriff). I did notice that using the dual UHF receive and tuning to
483MHz was better than using the straight UHF receive. (Remember, the
dual UHF RX uses the VHF section with reduced sensitivity. Well, its
reduced in the amateur portion, but seems to be enhanced out of the band!)
At around 506MHz (Los Angeles PD) its VERY weak. I could barely hear
anything WITH an outside antenna. Maybe some tweaking inside could
improve this (I haven't really looked for the VCO yet).

Many thanks to Pontus Hedman (rph@sq.com) for helping me put this
information together! Thanks also goes out to James Dugal (jpd@pc.usl.edu).
By the way, Pontus did mention that checking the input frequency was a bit
annoying. You have to hit FUNCTION SHIFT to get the radio to REVERSE and
listen to the input. I agree!

Anyway, hope this information helps you get more from you new toy!
Its a *REALLY* nice radio!!

Many hams are argumentative, many Usenetters are argumentative, and Usenet hams are really argumentative. The question of which is the larger group, the arguers or the non-arguers is a valid concern. I support the separation of rec.ham-radio into an argumenative group and a bland lifeless noncontroversial group. It would be easier to manage a subgroup named rec.ham-radio.bland than a rec.ham-radio.legal and would tend to keep the crosspostings to a minimum in the rec.ham-radio base group. Think about it.

>
>David L. Hirschberg

This antenna should work, not great mind you because you mounted it so close to the building, but it should work. Now the key question becomes how did you connect the coax to the antenna. A dipole is two pieces of wire with an insulator in the center. One piece of wire should be connected to the center conductor of the coax and the other piece of wire should be connected to the shield of the coax. The two pieces should not be shorted together. At the radio end of the coax, the center conductor should be connected to the center pin of your coax connector and the shield should be connected to the outer shell of the connector. It sounds like you have shorted the coax at one end or the other and that's preventing any signal from getting from the antenna to the radio. Recheck your connections, your design is sound.

8mm tape are typically 120mins long with no necessity to reduce speed.
To get the same portability, the VHS-C is comprimised in terms to record time.
They typically get 20min in standard play and 1hr in slowest speed, and
naturally the worst video image. Even in its fastest speed given camcorders
in the same price/feature catagory, 8mm is still better than VHS-normal, abeit
only slightly so...

There are commercial cards available for doing this, but you are on the
right track. You need a parallel port to drive the relays through the
transistor drivers provided in the 5400 and you need some form of A/D
conversion to read the position pots. The pots are powered by the control
box through a 7808 voltage regulator and a dropping resistor so some
hacking of your game port, which is also powered, will be needed to
make them talk without smoke. Amsat's Instatrack and Quiktrak will
drive the rotors for you after you customize the interface drivers
for your hardware.

> Anyone have any experience with this?

Icom demonstrates this at all the shows. It seems rather useless though
since, without a keyboard, you can't issue the necessary commands to
your data controller to get it to monitor the signal you are interested
in. Of course two way use is impossible without a keyboard.

> I have a Kantronics TNC-2 with rom update 2.83 (dated 1988). Is

> the 470 is the neatest handheld on the market.

I assume you meant a Kantronics KPC-2 and not a TNC-2. These are totally
different animals. The KPC is a good TNC but is neither firmware nor hardware
compatible with the TNC-2. There is not a dedicated KISS rom for it nor will
you be able to use the satellite modems or high speed modems that are available
for the TNC-2 since the KPC-2 doesn't have the TAPR TNC-2 modem disconnect

nor the TNC-2's Z80 architecture. With that in mind, get the upgraded firmware, there are substantial improvements in the later code. Using the KPC with an HT requires that you use an external antenna on the HT. The case of the KPC is not a very good shield and you have to get away from it. You can also tweak the crystal oscillator in the TNC to try to move the hash off your operating frequency. Another approach that works is to use long audio lines between your KPC and your HT. About a dozen feet of separation seems to work ok. I've found that the tin boxes MFJ uses in their 1270 series are a much better shield. The MFJ 1270, 1270B, and 1274 are TAPR TNC-2 compatible. The 1278 is not.

> Since we have satellite capability in the station, what PSK modem is
> the best? Is there one that we can piggy-back on an existing TNC,
> esp MFJ 1278 or TNC-2?

The kit from Radiokit works well with a TNC-2. Paccom has a similar unit assembled, and TAPR also has a kit. I'm not sure that you can interface any of these to a MFJ 1278, but any true TNC-2 compatible TNC will work.

I picked up a copy of the Washington Post today and noticed
that fellow satellite chaser Ted Molczan made the 'Around the Nation'
column (Page A16 Monday, November 19,1990). Apparently Ted noticed
something 'unusual' about the Shuttle and it's classified payload.
The article suggests that the Shuttle crew may have had to rescue
the spy satellite but NASA has remained silent on any possible problem.
Nice going Ted...keep 'em honest.

Some very good reasons were included when the original idea was posted.
I expect that even more good reasons will be added to the list when formal
discussion begins.

>their reasons for such. I get the feeling that some folks are outraged by any
>sort of controversy - they call it "flaming". Everything that is not milky

I do not feel controversy and flaming are the same thing. Controversy
may lead to flaming when emotions take control away from ones ability to
reason.
I suspect that even reasonable people get tired when any controversy repeats
the same arguments ad nauseum.

>Come on folks, let's not become too stultified. Sure, the code-no code
>discussion seems unending. So what? I would really prefer to exclude all the
>mentalities that are horrified ("bored") by controversy. Reasoned arguments
>are the spice of life. Even the Russians are able to disagree now without

In your opinion, but not necessarily others. We will see what the majority
think soon enough. The object of this idea is not to banish anyone to
"Siberia"...

Well, I missed the first half of it, but the second half was pretty good,
even though more than 1/2 the folks had already left! Jay Maynard
was running as net control when I got there. I know that John Moore
had been doing it before that.

I will not be on this coming weekend, but dont' let *that* stop you!
(or maybe I should say "So if the threat of my being their has kept
you off, now's your chance!" :-)

Does humour imitate life?

Because of all the "It's illegal" carping of the narrow minded
I and others have suggested that we create wrecked.ham-radio.lawyer
etc. This has been a quiet giggle for the past year or so. In fact,
just for giggles I have even created a newsgroup in my active file
called rec.ham-radio.lawyer.

It is interesting to note that the dull dreary goody-goody
attitude of the narrow minded has lead to the suggestion that they
get their own forum. But at least this will give them an opportunity
to drone on endlessly about matters legal and bureaucratic.

Of all the postings I have made here over the past 18 months,
the one that got the most response was a scenario I fabricated to
excite the armchair lawyers. I invented a scenario where I was on an
auto-patch and someone put me on hold. While on hold, a song and two
ads were played over the repeater. The response to this posting went
on for weeks. If I ask anything slightly technical, it is usually
ignored.

Maybe we should just call this group:
rec.ham-radio.humourless-bureaucrat

Why feed these people? Why don't we ignore them? Let's
treat them with the contempt which they deserve. Giving them a news
group will not stop them posting to rec.ham-radio saying: "Nja-nja,
you can't do that. I'm going to tell the FCC about you."

Some of my most instructive hamming was illegal. Yes, I will even
admit to running illegal phone patches on 2M and 23 cM between Sweden
and Denmark. So I suppose I am now an international felon. I have even
worked Germany, Holland, Belgium, Denmark and England from a
commercial aircraft using a 2M walkie-talkie. So want to know if you
can do this from a plane? Sure you can. Did it crash? Obviously not.
Did I have the captains permission? Well on some these jaunts the
captain (an SM) and I took turns working the rig. But 1,125 posters
here will tell you that the plane will crash and you will go to hell

after you have been to prison.

We now return you to the "You can't do that" postings that clutter
this forum.

P.S. Loved the posting about not being allowed to use radios on
Amtrak. Very funny.

I was talking to John Moore NJ7E today, and he asked me how the callsign
project was going. I told him, and he panicked. (Well,almost) So,
he suggested that I remind everyone that the callsign project is currently
underway (I await the data from the NTIS which I ordered a month ago)!

Get those cards and tapes in the mail, please! :-)

(Why did he near-panic? Because I told him it looked like the money
I had planned to spend on a dual-bander for the car would go instead
to pay for the FCC database... oops! :-(

I don't see the point in having another newsgroup. If the purpose
is to be what the name says -- discussion about legal aspects --
then I'd say it is directly relevant to ham radio in general and
there is no sense in sticking it out in a group of its own.

If the purpose is to segregate flaming (as opposed to real discussions)
then (a) the name is wrong, (b) it won't work anyway. The code/nocode
meatheads are not likely to have the good sense to keep their flaming
in the rec.ham-radio.useless-flaming newsgroup!

Source record: 6455

CW: A Morse Code Practice Program for the HP-48SX

CW is a directory containing several programs and variables which comprise a capable Morse code practice system for the user. The program can send code using the beeper at speeds slightly over 20 words per minute continuously, without encountering delays due to calculator "garbage collection". The user can set the overall speed and element speed independently, or can manually set the timing and delay for each element type. The program will create, send, and display five character random code groups, or the user can store any size string in a variable to be sent and displayed manually. The following descriptions explain the programs and variables and their use.

CGR (Code GRoups) is a program which creates a string of 25 five character random groups, sends them using the present speed parameters, and then displays them so the user can check his copy. The characters are selected from a string in CGR which contains all the characters and prosigns used in amateur radio license tests. If the user wishes to practice only certain characters, this string can be changed with 'CGR' RCL EDIT or 'CGR' VISIT and the groups will then include only the characters from the modified string.

SPD (SPeeD) is a program which calculates and sets the various parameters affecting the timing of each type of element. The program prompts the user for the overall speed in words per minute and the element speed, also in words per minute. After entering these two numbers on the stack, the user presses [LSHFT] CONT and the program stores values in ST, LT, ET, CT, and WT. SPD will not signal an error if speeds are set too high or if element speed is less than overall speed, but one of the values in ST, LT, etc. will be set to zero or negative and CWO will halt or hang. Calculator speed and overhead as well as time to do the garbage collect operation limit the speed to slightly more than 20 wpm if overall and element speeds are the same. If the element speed is set faster than the overall speed, somewhat higher speeds can be reached, 26 wpm overall with 29 wpm element speed being about the maximum in any case. The speed will be quite accurate, within 1% or so in most cases. The user can measure the speed if desired by storing the string "paris paris paris ..." in TXT and using a stopwatch to time from the first element of a word to the same first element a few words later. Divide the number of words timed by the number of seconds on the stopwatch and then multiply that by 60 to obtain the speed

in words per minute.

CWO (CW Output) is the program which actually sends the Morse code using the beeper. CWO sends the characters contained in the string TXT. TXT is set and CWO is called automatically by the CGR program, but the user can set TXT and then execute CWO manually to practice something other than random code groups.

DSP (DiSPlay) is a program which displays a screenful of characters from the TXT string. CGR calls this program to display the code groups it creates and sends. If TXT is more than one screen long, DSP halts after each successive screen. The user can view the next screen by pressing [LSHFT] CONT.

TXT (TeXT) is a variable which contains a string which will be sent as Morse code by the CWO program. Any ACSII character with decimal code 32 through 128 can be contained in TXT. Characters that have no representation in Morse code will be sent as a space. Note that some of the radio prosigns which have no representation in ASCII have been placed on some of those characters. For a listing of these, see the CODE variable. Note that lower case characters are folded into upper case.

CODE (CODE) is a variable which contains a list of short programs, one for each character. CWO disassembles this list on the stack before sending so that it can access the character codes much more quickly than by other methods. Prosigns which have no associated ASCII character are rather arbitrarily placed on the following characters:
understood (SN) !
error (HH) #
paragraph (AL) *
starting signal (KA) [
wait (AS) \
end of work (SK)]

ST (Short Time) is a numeric variable containing the basic element (dit) time in seconds, normally set at 1.2/WPM.

LT (Long Time) is a numeric variable containing the longer element (dah) time, set at 3*ST.

ET (interElement Time) is a numeric variable containing the delay time between elements. This is generally set at the same value as ST, less the calculator overhead time between elements, .04 sec.

CT (Character Time) is a numeric variable containing the delay time between characters. This is usually set to the same value as LT, adjusted for various calculator overhead times in the program.

WT (Word Time) is a numeric variable containing the delay time between words. This is normally set to 7*ST, adjusted for various calculator overhead delays.

FR (FRequency) is the frequency in hertz of the beeper. Set at 500 hertz, but the user may store any value which suits individual taste.

S (Short beep) is a program which actually sends a single dit element. The user will not use this program.

L (Long beep) is a program which actually sends a single dah element. The user will not use this program.

W (Word wait) is a program which generates the delay for a space character. The user will not use this program.

>Q: It is possible/how does one modify the Kenwood TH-75A to recieve
> beyond 450MHz up to at least 465? Is there a matching Xmit Mod?

Yes. I don't recommend doing the mod without the service manual in
front of you.

Referring to page 54 of the service manual, open the radio by removing
the screws above and below the PTT, the one screw on the opposite side
of the radio, and the two front battery plate screws. Lift the front
assembly off. Looking at the board in the front assembly (the control
unil board), near the bottom left corner of the main CPU is a jumper
wire. It's the only one on the board. Cut it. In the same location of
the wire are three diodes in this configuration:

D4
o D3
r6 o
r34 D2

You need to remove D4. The resistors are shown here for reference, and
the "o's" mark the point which the wire connects. This will, BTW, give
you all the VHF out of band TX/RX coverage also.

This will give you coverage (where the VCO locks) from about 380MHz to
458MHz as it sits. The actual passband of the front end is about a
35MHz window in that range. The next step is to re-align the VCO for
your desired frequency, and also the front end if you plan on hearing
anything above 458. You MUST have the service manual to go digging for
the VCO and the front end trimmers. It's not too difficult to get to,
but there are a LOT of screws to remove, and you will need to re-connect
the PC board jumpers so you can turn the radio on while having the boards
lying out on your workbench.

It is possible and relatively easy to re-align everything for coverage
from 435 to 475 MHz RX/TX. It works well with adequate power out and
good sensitivity across the whole range.

This mod is posted without any written or implied guarantee from either
me or Kenwood, and you perform it at your own risk.

Brent

3298. WN4KKN/ZP5

Netperson Trey WN4KKN will be operating ZP0Y during the CQWW contest this weekend. He is already in Paraguay, and I heard him on 10 and 15m within the last hour. Trey will also be doing some WARC band operation before and after the contest. QSL non-contest contacts (i.e. WN4KKN/ZP5) via AA5BT. For contest QSOs (ZP0Y), QSL via ZP5JCY, which means via LU8DPM - a slower but still reliable route.

Give Trey a call on as many bands as you can in the contest!

From: alanb@hpnmdla.HP.COM
Message-ID: <1250275@hpnmdla.HP.COM>
Source record: 6459

Re: two 1/4-wave verticals phased 90 degrees:

Note that the feedpoint impedance of the two antennas will not be the same. If you just run a 1/4 wave feedline between them, then even if you do somehow get the total feedpoint impedance to equal 50 ohms, you almost for sure will not have equal currents in each antenna.

Here's how I would do it. Build a matching network at the base of each antenna (PI-network, or whatever). Match each antenna to 50 ohms (with SWR meter) with the other antenna disconnected (open). Now connect each antenna to a common "Y" feedpoint, using 50-ohm coax. Make one coax 1/4 wave longer than the other. (Don't forget velocity factor.) Connect a transmitter to the "Y". Now, with an SWR meter at the base of each antenna, adjust each matching network for 1:1 SWR. There will be interaction, so you will have to iterate a number of times.

When you are finished, you will have a 25-ohm feedpoint impedance at the "Y", which can be matched to 50 ohms with another matching network. Each antenna should now have the same power being radiated, so the cardiod pattern should be correct.

>how to design projects using this (obviously) useful microprocessor.

I don't think this is much different from "construction" articles in
other mags. I see basically the same kind of projects in Popular
Electronics and Radio Electronics. Anytime an LSI chip is used in
a project, the inner workings of it may be proprietary, so that the
publisher can't divulge the "how it works" details even if he wanted to.
We use lots of chips in projects without really knowing what's going
on inside of them. If you think of them as "functional blocks" that you
need to accomplish some portion of a larger project, then there's no need.
The worst case occurs when the whole shebang in on a single (perhaps
proprietary) chip, In this case, there's not much we can do except to call
or write the chip mfgr and ask specific questions about what we want to
modify.

Thanks for these postings. I've been wondering if I should try to build
one of these keyers. I've been burned in the past by projects that seemed
great, only to find that they took weeks of troubleshooting to correct
errors made either by the author or the editor. I'm glad to know that
this project is free of such errors and that the parts really are available.

Tad,

Like you, as soon as I layed eyes on that article, I knew I HAD TO HAVE this keyer. I sent in my $48 (yes, I also thought it was a bit pricey) on Saturday, November 3, had the parts kit Friday, November 9, and fired it up Thursday, November 15. The "OK" in CW from the microprocessor is quite a surprise the first time (hi hi). I've tried just about all the features, and I'd give it very high grades. Being able to set and read the speed and being able to switch keyer polarity are the most useful. I tried using the "break" feature in the memory that allows insertion of variable info into the string (such as RST or call signs), but I found that you'd better not make a mistake or you'll find yourself doing the rest of the exchange with the paddle.

As for the case, I used a Radio Shack project case (5" X 2 1/2" X 1 1/2"), and it barely fit. The circuit board is tiny, but the batteries, speaker, stereo jack (for the key paddle), pot, four control switches, and phono jack (for the output) all take up room. I now see why the case in the QST article is exactly twice the size! I ended up mounting the switches and the circuit board on the left half of the aluminum face plate which forms the top of the otherwise plastic case, the speaker on the right half of the face plate, the battery pack below the circuit board (and glued to the bottom of the case), and the pot and two jacks below the speaker. I used a 1 1/2" speaker with the pot in front, the paddle jack on the right end of the case, and the phono jack output on the back side.

Its a great keyer. I have had no RF problems whatever, even running next to my Dentron KW amplifier.

I enjoyed your note and would like to hear if anyone else has built the keyer. Should be great in the next CW contest!

The '1278 can be _MADE_ TNC-2 compatible by pulling out a couple of ICs and replacing them with DIP headers. This is described in appendix E of the current (Revision 9) manual. Then a NET/ROM etc can be plugged in. I assume that this throws away all the '1278-specific features, in particular the non-packet operating modes...

- Jerry Kaidor, KF6VB
p.s. I know this 'cuz I just bought one _today_, and I'm sitting here with the manual in front of me. Can't wait to get home!

>there is no sense in sticking it out in a group of its own.

Packet radio is relevant to ham radio in general. For ANY group all
subtopics are relevant in some way. This is an argument for usenet
to limit itself to two levels of hierarchy and large flat newsgroups.

The question might be better posed as: Is it relevant to the majority
of the people who discuss ham radio in general. If r.h-r.legal is going
to have everyone reading it as r.h-r, then there is no need to split.
for those (such as myself) who will read r.h-r.legal, there will be no
reduction in the number of articles to pick through. But I really suspect
that many will not read it.

But there is the issue of whether or not we want all legal issues in the
subgroup or just those that pertain to the FCC.

>If the purpose is to segregate flaming (as opposed to real discussions)
>then (a) the name is wrong, (b) it won't work anyway. The code/nocode
>meatheads are not likely to have the good sense to keep their flaming
>in the rec.ham-radio.useless-flaming newsgroup!

If you segregate flaming for the sake of flaming, of course no one will
flame there. But if the subject has merit, then it will work, I believe.
Part of the reason for flaming in the first place is people who really
have no interest in what they posted in, posting something off the wall
and getting someone else ticked off. I believe that if you make it easier
for some people to NOT read some articles, then the number of flames will
go down. I believe that if we had this group all along, and if no one
posted anything FOR EITHER SIDE anywhere other than r.h-r.legal then many
would not have read the issue at all and would not have posted something
that someone else considered worth flaming on.

I'm still for rec.ham-radio.legal or rec.ham-radio.fcc whichever seems
the more appriate. Most things will fit under both.

>ohms (with SWR meter) with the other antenna disconnected (open).

I've often thought about this problem, and I keep running into the
same question. How do you guarantee that the phase shifts through
both matching networks are identical? As you said, the feed point
impedances of the two antennas will probably not be the same, so even
if you used a simple L-network for matching, the phase shifts would
not be identical. Any significant difference in phase shifts will
ruin the pattern of the array.

Where do you get off assuming this sort of nonsense? I am infavor of
such a group, and I LOVE controversy.

>Come on folks, let's not become too stultified. Sure, the code-no code
^^^^^^^^^^
That's why were trying to move the never ending, no new ideas circular
discussions to another group.

>discussion seems unending. So what? I would really prefer to exclude all the
>mentalities that are horrified ("bored") by controversy. Reasoned arguments

Once again, you seem to be a bit confused about motives, and perfectly willing
to make ad-hominem attacks on those who support this idea. If this is your
idea of controversy, bug off.

>are the spice of life. Even the Russians are able to disagree now without
>being sent to Siberia!

Yep - so let's hear some of your reasons, rather than just ad-hominem
flaming, OK?

By the way - next time you see an original thought in the code/no-code
debate, why not let us know? I haven't seen one in a long time.

I have the instructions for the mod to allow out of band
transmit for the 32AT, but I wondered if there was anyone here
who had done it. I would like to learn of your experience before
I go ahead.

(Yes, yes, I know this is all wrong, type-accepted radios, etc.,
but I want to have a backup to my marine radio in case it goes
out just when I need it -- as it did once.)

Bravo Derek! But why stop with ham.radio-ostrich ;-) how about:

ham.radio-dx
ham.radio-contest <Maybe this one shud be ham.radio.QRM>
ham.radio-code-nocode
ham.radio-antennas
ham.radio-flame
ham.radio-lids
ham.radio-gods.major
ham.radio-gods.minor
...ad nauseam...

See the beauty of this? Then we wouldn't need ham.radio-ostrich ;-)
Come on people, variety is the spice of life as they say, if you don't
like a certain topic theres always the 'n' key, rn macros, kill files
etc. etc. I for one don't believe there is any need to further fragment
this news group. Of course I like hot and spicy Mexican food also and
I realize there are lots of people who don't get much past milk and
cookies :-)

Some time ago, someone posted plans for a two-meter co-linear vertical. It was made of pieces of coax soldered up together (short here, don't short there, reverse the shield here, etc). I saved a copy, but seem to have misplaced it. Anyway, now I need a roof-mount antenna. I'm getting started in packet, and I discover that it's done simplex, and the ole 1-watt-to-a-rubber-duckie just won't cut it anymore. So does anybody have that article?

PROPAGATION FORECAST BULLETIN 47 ARLP047
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 19, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS DOWN TO 140 ON NOVEMBER 2 BUT IT ROSE RAPIDLY,
REACHING 215 ONLY FIVE DAYS LATER. IT DROPPED BACK TO 186 BY
NOVEMBER 13, BUT RECOVERED QUICKLY AGAIN, RISING TO 223 BY THE 17TH.
THIS WAS THE HIGHEST FLUX READING SINCE THE MIDDLE OF OCTOBER.

TWO LARGE SPOT GROUPS THAT CAME INTO THE EAST LIMB OF THE SUN ON THE
14TH SEEMED TO BE THE MAIN SOURCE OF THE RISE. EARLIER GROUPS THAT
WERE RESPONSIBLE FOR THE 215 PEAK ON THE 7TH DISAPPEARED AROUND THE
WEST LIMB EARLIER IN THE MONTH.

NEITHER OF THE FLUX PEAKS WAS ANYTHING LIKE THE OUTBREAK THAT
PRODUCED THE SURPRISE PEAK OF 315 BACK IN AUGUST, BUT THAT CAME AT
THE WRONG TIME OF YEAR TO DO MUCH GOOD FOR DXERS.

IF THE REST OF NOVEMBER FOLLOWS RECENT MONTHLY TRENDS, WE CAN EXPECT
LOWER FLUX LEVELS THIS WEEK, AND PROBABLY THROUGH THE REST OF THE
MONTH. THIS WOULD HAVE LITTLE EFFECT ON THE MAJOR DX BANDS, BUT IT
MAY SLOW DOWN DX ACTIVITY ON 50 MHZ, AND POSSIBLY 28 MHZ, ESPECIALLY
IN THE LAST DAYS OF THE MONTH.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 8 THROUGH 14 WERE 199, 156,
125, 98, 108, 110 AND 115 RESPECTIVELY, WITH A MEAN FIGURE OF 130.1.
SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE
212, 202, 193, 197, 194, 186 AND 201, WITH A MEAN FIGURE OF 198.

On the other hand.....

Many software listings are mighty long. Magazines these days are usually not willing to "waste" their pages on long listings. A good compromise, however, would be for the author or magazine to provide program listings for a nominal cost upon request.

3331. 8031 Keyer Project

Newsgroup: rec.ham-radio
Date: 1990-11-22 00:09:33 UTC
From: bill@b11.ingr.com
Message-ID: <9473@b11.ingr.com>
Source record: 6241

About a year ago, while waiting for my novice ticket to arrive in the mail, I built a keyer which is similar to "CMOS Super Keyer II" 11/90 QST. I thought about trying to get an article published, but I felt that the project was probably too expensive "just for a keyer", and doubted that there were many folks out there that had the resources required to customize the firmware.
My keyer is based on the 8031 and an external eprom. This combination has been used in several BYTE projects by Steve Ciarcia, and I found a nice cross assembler on his BBS. In addition to lots of I/O pins on the 8031, there is a built in serial port, which allows me to use my PC's keyboard to send code. I added an nvrom and some extra ram, and an A/D to read a couple of pots for speed control and the like.

If any of you are interested, please drop me a line, and if there is some interest, I will try to find a way to make my stuff available. I'd like to thank Joe, KM4JN, for many good ideas about keyers and Preston Jett for his help with the hardware design.

Bill Welch AB4YD uunet!ingr!b11!bill
ps I think the author's of the above mentioned article did a great job, and I wish I had thought of some of the features they did!

I have actually tried this, with varying results:

SRI OM HAD TROUBLE COPYING NO QRM OR QRN, AND UR SIGS FB, BUT
WHAT DOES CCIIOIICOC MEAN?

If they are trying to send too fast, I may ask them to send slower.

Another one that can drive me up the wall is if I am operating CW
mobile, and I hook up with SOMEONEWHORUNSALLTHEWORDSTOGETHER. Very
hard to figure out while driving. I just tell them that I copied
nothing, and to send a little slower with plenty of time between
each word. This problem is especially bad if they can't spell!

This would require a 37.5 ohm quarterwave matching section. 37.5 ohm cable is not off-the-shelf at the local parts house. If instead, you use two 75 ohm matching sections before the combining junction, then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-the-shelf. Sometimes you need to check your design for what parts are commonly available.

3334. Club stations...

Newsgroup: rec.ham-radio
Date: 1990-11-22 04:40:28 UTC
From: dusan@batserver.cs.uq.oz.au
Message-ID: <5855@uqcspe.cs.uq.oz.au>
Source record: 6244

This is my second posting because the one I sent a couple of months
ago within Australia was a disaster (nobody responded!) and there
might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me
b. there were/are not many VK-hams on the Inet
c. people were lazy to comment believing
that "someone else" would do so...
d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in
Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia
with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge
to learn something about club stations in other countries...
Funny, I never asked myself that question when I was in YU because
I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there
are no radio-clubs here in VK4 (I am talking about Brisbane,
at least) that have much in common with the organization and
activities of the clubs in the area where I used to live -
that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club
in the town called Titograd and was located almost in the very
centre (founded back in 1946). The vicinity of a TV station
did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and
gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)
- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an
non-profit and educational organization so the rent of these
premises was a trifle. Let's say that the renting was almost
free!

We found enough retired people who were hams that were more than willing to come every afternoon between 17:00 and 20:00 and open the club for public. They were also taking care of the club's property, etc. Of course, they got paid for this work - it was not much but still it helped them... There were some additional keys of the club which could use just approved persons (those that could be trusted - at least in opinion of the club Secretariat - in fact we never made a mistake and no one complained about this).

We subscribed to several radio-amateur magazines and everybody could come and read them. Also, we managed to complete a pretty good library of electronics and computer books and periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of young people. Often it was because they would hear some "dit-dah" noise outside while they were passing-by, and they wanted to check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories, various organizations, etc. We were organizing joint activities with Scouts Association, Youth Association, Society of blind people, schools, etc.

Usually several times a year we were given some old equipment from the Post, Army, Police, Factories (spare parts were not much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help, otherwise there were/are so many other interesting activities... (I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs. We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some facts.

To all hams that might read this posting I wish good health (before everything!) and enjoy your hobby. That's it: ENJOY IT. And I still like 10m band...

And please comment on this if you have something useful to say,
for the benefit of ham-radio (or, at least to satisfy my interest).
If you want to make fun or to make others look funny then please
mail me direct - without bothering others. Yes, I know it is easy
to be smart - and very easy to critisize others!

Dusan (aka Dule), YU6FO/VK4

Jim, unless you can get your program licensed by the FCC as a control operator, it does NOT comply with the rules requiring a control operator to screen traffic before it goes on-air.

>in just over a year. Of course, I read the books, but the ability to have
>hypercard test me over and over again helped me realize where I needed more
>studying (and helped me with the famous exam nerves syndrome.)

Early in 1990, I set out to complete my New Year's resolution of obtaining my novice and tech license. I went about 2/3 of the way through a class taught by the Stanford amateur radio club, but never took the test. Then a little over a week ago, I found the HyperCard stacks on apple.com (ftp), and decided to go for it once again. I had forgotten almost all of the code I learned at Stanford, but with the Mac "Morse" program, and the HyperCard stacks, I really studied intensely for five days (though my four years studying Electrical Engineering did help too), and last Sunday I took the Novice written test (missed two questions), and the Tech written test (perfect score) and the code test (perfect score). Sure was a hell of a lot easier with the Mac rather than reading the boring books...

>So, Diana, for all of us: Thanks so much!!!

I second that whole-heartedly! One minor thing: The stacks I have don't have any version number (I retrieved them a few weeks ago from apple.com) in them, but they did seem to have some problems occassionally - they would stop in the middle of a test and tell me (on the summary page) that I had missed all of the remaining questions. Strange. Oh well, I passed anyway!

Source record: 6247

Thanks for the info, It's nice to know that ICOM USA are handling
things. The only remaining questions are:

Is that $25 battery swap conditional upon the rig still
functioning, or can they include reprogramming ?

Do ICOM have similar service in other countries ?

Have any other manufacturers used battery maintained firmware?

When rigs are 15 or so years old, how much interest have
their manufacturers shown in them ?

I don't have anything at risk myself, but I do seem to be spending
an increasing amount of time with other peoples gear laid out on my bench.
I just want to be able to avoid such pitfalls as swapping a lithium cell
in the safest way (WITH NO EXTERNAL POWER APPLIED) only to discover
a catatonic microprocessor.

NB some lithium batteries carry dire warnings of risk of explosion
and have maximum permitted reverse currents of 0.05 MICROAMPS. using
an external supply carries more risks than just a transient corrupting
the data.

Many thanks, GM4ZNX

Technical Opinion:
I believe Jim transmits from Canada, and thus the FCC has *no* say in the matter. Furthermore, Jim is no doubt aware of the relevant Canadian DOC (Department of Communications) regulations.

Logical Opinion:
But I think you are being a bit picky about the regulations. Being too picky could unduly restrict some pretty major innovations, and I think Jim provides a useful service.

I am presently involved in the organization of a Soviet-led
expedition to Bering Island , in the Komandorskij group.
The provisional dates are July22nd - August 18th 1991.

It is possible that there will be one , possibly two, places
unfilled which could be available to ham(s) from the USA.There
are 4 Soviets , 2 Brits (including myself) and 3 Danes, and
3 hams from the USA are required , I believe that all but one or
two of the places for the USA have been filled.

I have more information available for anybody interested , and
will be happy to hear from anyone via e-mail.

I can guarantee that it will be a fascinating trip , I was UA0/G0GWA
in the Arctic earlier this year and had a great time over there.

73s,

Simon Browne , G0GWA.

Show me where in the regs it says a control operator may not employ mechanical aids to facilitate the screening process by marking for human review all messages containing certain key words and phrases he has selected for use in a grep process.

Let's not try to be more British than the British here. As I said, the FCC expects a good faith effort, but they're not dumb enough to expect 100% accuracy EVEN WITH 100% EYEBALL INSPECTION. No matter how it is done, a tiny percent will slip through when somebody yawns or blinks.

I am not replying to your comment everywhere you posted it. People jump on ME for answering articles in all the newsgroups the originals appeared in. Go figure!

Your description of your old club reminds me a little of the HARC,
the Henderson Amateur Radio Club, of my youth. We too had a nice
clubhouse on property leased from the city for a dollar a year.
We had two state of the art stations setup in rooms at opposite
ends of the clubhouse. We had a central meeting room and a kitchen
and storage rooms for parts and gear. We had about a hundred active
members in a town of 16,000 and sponsored radio clubs in the local
schools. We held classes twice a year for new licensees. That's how
I got my license, through the school radio club and the HARC classes.
We built the first two meter repeater in our area and arranged for
a group buy of surplus Motorola 5V tranceivers for our membership.
We had great fun sitting around the meeting room trying to modify
those beasts to work on two meters. We participated as a club in
many contests, especially field day where we made a maximum effort.

I moved away about twenty five years ago and lost touch with the
old HARC. Sadly, I met one of the old members last year while
visiting the area and found out that the club had fallen apart
and had abandoned the clubhouse and the school radio clubs and
the licensing classes. They only had about a dozen members left,
but they did have one of those talking, singing, dancing, autopatching
repeaters on the HARC channel. All of the old partially homebrew
radios were gone. And nobody wanted to bother to leave the air-conditioned
comfort of their homes to go out in a field with bugs and heat to do
field day. They had quit holding meetings and were content to talk

to each other via their Japanese made handhelds.

I now live near Atlanta, Georgia and don't know of any clubs like the old HARC. I do know of several clubs like the new HARC. I have no magic wand to bring back the good old days. People seem so busy and wrapped up in their own lives that they don't have time for clubs like the old HARC. It's a great loss to amateur radio.

3345. QRP on 20 meters

Newsgroup: rec.ham-radio
Date: 1990-11-22 19:44:41 UTC
From: johns@uhunix.uhcc.Hawaii.Edu
Message-ID: <10376@uhccux.uhcc.Hawaii.Edu>
Source record: 6263

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK,
a 2 watt station on 20 meter SSB. He was using a TH7DX tribander,
but I was still surprised at his signal strength, about S-2. On
my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts.
I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically
on top of us so I had to increase power again... we tried 15 meters but
no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver.
He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run
low power. It sure does help to have a good antenna! Of course,
if we had been on 10 meters, the QSO would have been a lot longer.

I dont think that starting any other groups would give any relief at all. Notice how all other ham/shortwave groups only seem to contain multiple postings.

The offending parties are trying to, in their eyes, convert everyone to their views. How can they do this if the unconverted read elsewhere ?

Count on my vote for a .tech group. With the sort of impression that the windbags give, what we enjoy should really bore the pants off them :-) We'd still need kill files to ignore multiple postings.

========================
AMSAT-DL officials have been informed that the launch of RS-14/RUDAK-2 will
occur on or about November 29, 1990, plus or minus one day. Also, it is not
expected that the RUDAK-2 transponder will be turned on until three days after
launch. Radio amateurs should not expect to hear the CW beacon from RUDAK-2
until December 1, 1990. Efforts are still under way to provide a launch net
on 20M starting about an hour before launch. UA3CR requests the help of radio
amateurs worldwide to help collect telemetry and send it to him via packet
radio to him once the CW beacon is turned on. The CW telemetry beacon can
be heard on a downlink frequency of 145.822 or 145.948 MHz SSB.

The CW Morse-Code telemetry frame will consist of the registration call RS14
and 8 four-digit lines in the following format:

RS14 1A 1B 1C 1D
2A 2B 2C 2D
3A 3B 3C 3D
4A 4B 4C 4D
5A 5B 5C 5D
6A 6B 6C 6D
7A 7B 7C 7D
8A 8B 8C 8D

The 1A to 7A lines are analog telemetry data. Line 8A is a calibration
engineering parameter.

The first digits from 1A to 8A are system status data. Figure 6 means
general operating status and figure 2 means command operating status.

The second digits from 1B to 8B (0 to 7) are line (channel) numbers.

The third and fourth digits from 1C to 8D are analog telemetry values.
```

RS14 Telemetry Decoding Parameters:

Line # Parameter Formula Unit

0 Transponder power output 0.05N Watts
1 Transponder PA Temperature N Deg. C
2 +24 V Regulated Bus N Volts
3 +16 V Regulated Bus N Volts
4 + 9 V Regulated Bus N Volts
5 +24 V Regulated Bus N Volts
6 Inside Temperature N Deg. C

Jim has transmitted from Toledo, Ohio, for almost 40 years, but that's beside the point. The FCC regulations specify certain prohibited types of communications. They don't say diddly about HOW the control operator goes about achieving compliance. For all the FCC cares, the control operator could hire that band of monkeys who could write the complete works of William Sheakespeare of you give them enough time.

I was under the impression that anyone entering a service academy was intelligent enough to realize that (a) he was entering into a contract voluntarily and (b) that he had read and understood it before signing.

My mistake.

You know, I get a little griped by the intellectuals who look down their noses at soldiers, policemen, etc., as somehow inferior and/or deranged UNTIL "the gook" or "the perp" gets into their personal space and THEN they scream "What took you so long to get here?"

Such is life.

Subject: Club stations...
To: info-hams@ucsd.edu

This is my second posting because the one I sent a couple of months
ago within Australia was a disaster (nobody responded!) and there
might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me
b. there were/are not many VK-hams on the Inet
c. people were lazy to comment believing
that "someone else" would do so...
d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in
Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia
with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge
to learn something about club stations in other countries...
Funny, I never asked myself that question when I was in YU because
I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there
are no radio-clubs here in VK4 (I am talking about Brisbane,
at least) that have much in common with the organization and
activities of the clubs in the area where I used to live -
that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club
in the town called Titograd and was located almost in the very

centre (founded back in 1946). The vicinity of a TV station
did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and
gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)
- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an
non-profit and educational organization so the rent of these
premises was a trifle. Let's say that the renting was almost
free!

We found enough retired people who were hams that were more
than willing to come every afternoon between 17:00 and 20:00
and open the club for public. They were also taking care of
the club's property, etc. Of course, they got paid for this
work - it was not much but still it helped them... There were
some additional keys of the club which could use just approved
persons (those that could be trusted - at least in opinion
of the club Secretariat - in fact we never made a mistake and
no one complained about this).

We subscribed to several radio-amateur magazines and everybody
could come and read them. Also, we managed to complete a
pretty good library of electronics and computer books and
periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of
young people. Often it was because they would hear some "dit-dah"
noise outside while they were passing-by, and they wanted to
check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories,
various organizations, etc. We were organizing joint activities
with Scouts Association, Youth Association, Society of blind
people, schools, etc.

Usually several times a year we were given some old equipment
from the Post, Army, Police, Factories (spare parts were not

much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help, otherwise there were/are so many other interesting activities... (I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs. We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some facts.

To all hams that might read this posting I wish good health (before everything!) and enjoy your hobby. That's it: ENJOY IT. And I still like 10m band...

And please comment on this if you have something useful to say, for the benefit of ham-radio (or, at least to satisfy my interest). If you want to make fun or to make others look funny then please mail me direct - without bothering others. Yes, I know it is easy to be smart - and very easy to critisize others!

To: info-hams@ucsd.edu

On the other hand.....

Many software listings are mighty long. Magazines these days are usually not willing to "waste" their pages on long listings. A good compromise, however, would be for the author or magazine to provide program listings for a nominal cost upon request.

Subject: Glen Hauser to move to WWCR! (Listening Tip)
To: info-hams@ucsd.edu

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen Hauser will be heard on WWCR, The powerhouse international broadcaster, beginning Sunday 25 November 1990. His broadcasts will then be aired regularly thereafter. Convieniently scheduled for 8:30pm Eastern Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have

all the impirical evidence he needs. And if they don't... Well we won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

=====

RNI and its rotating schedule

=====

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very regular schedule. Unfortunately, the best program host (Johnny Lightning) is heard only once a week. My own personal LEAST-favorite (Pirate Joe) is heard twice a month (or more depending on the month) Now if you are a lefty liberal 1960's anti war-save the wales-peacenick who gets into those old vietnam era protest songs and mindset, YOUR mileage might vary. I prefer irreverance and biting satire, ala Johnny Lightning to the predictable Pirate Joe. Other shows include "A different kind of oldies show" which is not all that different a kind of oldies show, really... AND the Steele Ship (host Randi Steele), who is in a similar mold to pirate joe, but not quite as bad. So far, the WORST RNI program was Pirate Joe broadcasting a distorted recording of the ANTI WAR rally which took place in NYC in protest of the Desert Shield Situation. Joe must be in his glory with another war to protest. EVERYONE I know who listens to RNI flipped the station off after the program got interminable. I bet even the most loyal RNI listeners just could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT NIGHT?

That's all of my time.

Thank you for Yours.

Help!

I would like to obtain the ground station software for the new pac-sats.
Would anyone consider mailing me a copy on disk...(360k,1.2meg or 1.44meg)?

I have a compuserve account that I have not used in over 3.5 years....frankly
I forgot all the local acess numbers and how to use the networks to get into
it. (I DO remember my account and password!)

I really do not want to call the Dallas DRIG BBS....I have only have access to
300 baud during daytime rates!

Thanks for your help in advance......

Subject: ICOM Batteries (memory)
To: info-hams@ucsd.edu

There have been several postings on here lately about the battery
in some ICOM HF radios that holds memory. Some folks fear that the
battery will wear out in a few years, and they sill be stuck with a
microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries
in ICOM radios (I'm NOT talking about the battery that POWERS your HT!)
have a predicted life of over 15 years. If you want to replace yours
before it runs out, and are afraid of losing memory, float a power supply
across the battery that is set at about the same voltage as the battery.
Then remove the battery, and replace it. Keeping voltage on it will
keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they
will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is
76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple
of variations of domain addresses could help if you want a reply.

Piffle! A good EDMEESE type program should catch 99.9% of the possible improper
messages. As long as we make a good faith effort to comply, the FCC won't
nitpick if an occasional clinker slips through.

Me, too, but what good is it if everyone does multiple posts? With RARE exceptions the only time I post an article in two or more newsgroups is in reply to someone else who did (and I'm therefore uncertain which one he's actually reading). But some people do it habitually. That would tend to defeat the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more descriptive.

Subject: Callsign project
To: info-hams@ucsd.edu

I was talking to John Moore NJ7E today, and he asked me how the callsign
project was going. I told him, and he panicked. (Well,almost) So,
he suggested that I remind everyone that the callsign project is currently
underway (I await the data from the NTIS which I ordered a month ago)!

Get those cards and tapes in the mail, please! :-)

(Why did he near-panic? Because I told him it looked like the money
I had planned to spend on a dual-bander for the car would go instead
to pay for the FCC database... oops! :-(

Subject: Club stations...
To: info-hams@ucsd.edu

This is my second posting because the one I sent a couple of months
ago within Australia was a disaster (nobody responded!) and there
might be some reasonable explanations, so either:

a. VK-hams were not interested to answer me
b. there were/are not many VK-hams on the Inet
c. people were lazy to comment believing
that "someone else" would do so...
d. or I was boring...

Anyway, here it is again.

I have been a ham for 18 years now (I am 31 years old) and back in
Yugoslavia I had a call YU6FO (ex YU6ZCW). I am now in Australia
with my family and am actively engaged in getting my VK-call soon.

I have taken the trouble of writing this because I feel an urge
to learn something about club stations in other countries...
Funny, I never asked myself that question when I was in YU because
I had a feeling that all the clubs work under similar principles.

The reason: well, to my disappointment I have found out that there
are no radio-clubs here in VK4 (I am talking about Brisbane,
at least) that have much in common with the organization and
activities of the clubs in the area where I used to live -
that is YU6 and YU4-land.

As an example I'll take YU6BLM. It was a main radio club
in the town called Titograd and was located almost in the very
centre (founded back in 1946). The vicinity of a TV station
did cause problems a couple of times but we managed to handle them.

Well, the club had several rooms:

- a "social-events" room (general meetings and
gatherings)
- a library
- a CW-learning room (with a lot of keyers...)
- a shack (HF, VHF/UHF
- a "spare-parts" room (we called it magazine)
- a do-it-yourself room (with all the tools...)
- a computer room (with C-64 in my time)

We have got a special grant from the Township Committee as an
non-profit and educational organization so the rent of these

premises was a trifle. Let's say that the renting was almost free!

We found enough retired people who were hams that were more than willing to come every afternoon between 17:00 and 20:00 and open the club for public. They were also taking care of the club's property, etc. Of course, they got paid for this work - it was not much but still it helped them... There were some additional keys of the club which could use just approved persons (those that could be trusted - at least in opinion of the club Secretariat - in fact we never made a mistake and no one complained about this).

We subscribed to several radio-amateur magazines and everybody could come and read them. Also, we managed to complete a pretty good library of electronics and computer books and periodicals.

The money for our activities was coming from several sources:

- Youth organizations
- Educational institutions and organizations
- Industry (Manufacturers,...)
- Township budget

All in all, it was not bad. And we managed to attract a lot of young people. Often it was because they would hear some "dit-dah" noise outside while they were passing-by, and they wanted to check what it was... Or we would give some lectures in schools...

Also, we visited schools (primary and secondary), factories, various organizations, etc. We were organizing joint activities with Scouts Association, Youth Association, Society of blind people, schools, etc.

Usually several times a year we were given some old equipment from the Post, Army, Police, Factories (spare parts were not much of a problem) and that helped us quite a bit.

I can proudly say that probably a couple of hundreds of people learned the basics of Morse code, electronics... in a couple of years time (remember: learning CW takes some six months of work - for an average person that does not want to practice it 20 hours a day).(PLEASE DO NOT COMMENT MUCH ON THE TIME a person needs to learn CW; I learned it in 1972 in ONE DAY and I can cope with speeds of 25-30 groups without problems AND I AM NOT A GENIUS. You know, we all differ!) And I never pushed people into CW - if they wanted to learn I was there to help, otherwise there were/are so many other interesting activities... (I personaly dislike contests but I have never laughed at people that think the opposite...)

At the same time, we tried to "spread" our club - actually we realized that in the town with about 100,000 inhabitants one club was not enough. So we began forming other clubs in suburbs and interesting places:

- YU6GBA
- YU6GBB suburb
- YU6GBC
- YU6GBD factory
- YU6GBF
- YU6GAS University of Titograd

In the begining, all these clubs were under supervision of YU6BLM, and later they got their "authonomy" (Hi, what a strong word in the world of ham-radio!).

The equipment in the shack was used only by licenced operators and we never had a problem of a misuse. That way, the hams that could not afford buying their own equipment were still able to practice and work. We even had more equipment than we needed, so it was decided that those hams that could prove having an interest in ham-radio should get some of the equipment and use it at home.

Believe it or not, but back in 1981-1985 (that was a period of blossoming) our clubs were full with members. The parents of children were grateful for the opportunity because they knew where their kids were and what they were doing (please, do not comment on this with jokes...- I have a 3-year old daughter and even NOW am worried what might happen in the future).

Occasionally we would organize some VHF/UHF expeditions and it was wonderful (some of you people might remember those first visits to the rare JB47 locator near the ZA-border...).

All courses and seminars were free. That included the RAEs. We believed that it would not be fair to children and others if they had to pay for exams... And to be frank, everything costs nowdays so would't it be great to have something FREE.

So, that is about it. I do not want to praise myself and our clubs but would like to know how others deal with this.

Do you have clubs like that? Is it free when you want to take an amateur exam? Do you attract enough youngsters nowdays? What is the main characteristics of the new amateurs (young, male, retired, or...)
(OLDER PEOPLE PLEASE DO NOT FEEL OFFENDED: I have always been looking forward to "recruiting" ANY person in ham-radio, and I stressed the importance of youngsters because the future belongs to them).

It was not my intention to explain all the details about the activities of radio-clubs (because it would take much more space) - I gave just brief details which might explain some

facts.

To all hams that might read this posting I wish good health
(before everything!) and enjoy your hobby. That's it: ENJOY
IT. And I still like 10m band...

And please comment on this if you have something useful to say,
for the benefit of ham-radio (or, at least to satisfy my interest).
If you want to make fun or to make others look funny then please
mail me direct - without bothering others. Yes, I know it is easy
to be smart - and very easy to critisize others!

PS. I talked about the situation in YU6BLM as an example. I do not
say we did it the right way (who knows?!) but I really would like
to know your way of doing it. And yes, I have no idea what is
going on in YU6BLM now...

On the other hand.....

Many software listings are mighty long. Magazines these days are usually
not willing to "waste" their pages on long listings. A good compromise,
however, would be for the author or magazine to provide program listings
for a nominal cost upon request.

Subject: Glen Hauser to move to WWCR! (Listening Tip)
To: info-hams@ucsd.edu

Popular Monitoring Times Columnist and host of WORLD OF RADIO, Glen
Hauser will be heard on WWCR, The powerhouse international broadcaster,
beginning Sunday 25 November 1990. His broadcasts will then be aired
regularly thereafter. Convieniently scheduled for 8:30pm Eastern

Standard Time (0130UTC while the USA is on Standard Time), and blasted out with a few MILLION watts of ERP on 7520 KHZ, Glen will be heard for the first time reliably in Europe.

You might be aware that Glen's WORLD OF RADIO has aired for many years over WRNO, the one time powerhouse gone flea power. With the WRNO signal now more of a JOKE than a broadcast service, Hauser has made the right move.

Interestingly, the program will air RIGHT BEFORE the four hour weekly broadcasts of RADIO NEW YORK INTERNATIONAL, making sunday a true night for good listening for the shortwave buff.

If you are a regular listener of Hauser's program, you are no doubt aware that it is a mixture of Good DX and station news, tips, tidbits, and a smattering of left wing political commentary. Hauser is an athiest, and in the past has featured "TIPS FOR RATIONAL LIVING" as part of his program. This feature ridicules religious practice, and promotes humanism. I will be very interested to see if Hauser continues this feature now that his program will be heard over WWCR, which is a Christian Station.

Most of the programs aired during the week on WWCR are a mix of Religious programs, most of them in the old time religion vein during the day. In the evening, the station switches to talk shows from the SUN RADIO NETWORK, with Chuck Harder (Consumer help and weird science) and Tom Valentine (Right Wing Politics and WEIRDER science).

Last week Harder talked about the N-MACHINE, which is a device that is supposed to produce more electric power than it takes in, making it in effect a perpetual motion machine. Valentine, not to be outdone, had on a man who claims that his invention has lowered SMOG in Los Angeles, through manipulation of the "ether". The anti-smog machine has no moving parts, but relies on its geometric shape to dispell the noxious fumes. He wants the Los Angeles City Government to pay him a million dollars a month to continue his services. He cites the figures that prove his device works, and even uses newspaper headlines about lower smog levels. Since Los Angeles is ignoring him, he is packing up his technology and going to Japan with it. He says "Just you watch. NEXT YEAR the smog levels will increase". Of course if they do, he will have all the impirical evidence he needs. And if they don't... Well we won't hear from HIM any more.

In any case, HAUSER has also ridiculed these programs, and encouraged people who have any scientific knowledge to call and try and debunk these guys. When someone DOES call though, Valentine refuses to let them speak if they disagree, or he chides them. After being so critical of the station and its programming, Hauser now finds himself on the same station.

It is probably NO ACCIDENT though that WORLD OF RADIO will be airing immediately before RNI's weekly shows.

=====

RNI and its rotating schedule

=====

7520 KHZ 0200 - 0600 Z Via WWCR Sunday (USA) Monday (UTC)

Radio NewYork International, meanwhile has settled down to a very
regular schedule. Unfortunately, the best program host (Johnny
Lightning) is heard only once a week. My own personal LEAST-favorite
(Pirate Joe) is heard twice a month (or more depending on the month)
Now if you are a lefty liberal 1960's anti war-save the wales-peacenick
who gets into those old vietnam era protest songs and mindset, YOUR
mileage might vary. I prefer irreverance and biting satire, ala Johnny
Lightning to the predictable Pirate Joe. Other shows include "A
different kind of oldies show" which is not all that different a kind
of oldies show, really... AND the Steele Ship (host Randi Steele), who
is in a similar mold to pirate joe, but not quite as bad. So far, the
WORST RNI program was Pirate Joe broadcasting a distorted recording of
the ANTI WAR rally which took place in NYC in protest of the Desert
Shield Situation. Joe must be in his glory with another war to protest.
EVERYONE I know who listens to RNI flipped the station off after the
program got interminable. I bet even the most loyal RNI listeners just
could not take this program. HOW ABOUT IT, ANYONE ELSE LISTEN THAT
NIGHT?

That's all of my time.

Thank you for Yours.

Help!

I would like to obtain the ground station software for the new pac-sats.
Would anyone consider mailing me a copy on disk...(360k,1.2meg or 1.44meg)?

I have a compuserve account that I have not used in over 3.5 years....frankly I forgot all the local acess numbers and how to use the networks to get into it. (I DO remember my account and password!)

I really do not want to call the Dallas DRIG BBS....I have only have access to 300 baud during daytime rates!

Thanks for your help in advance......

From: pilchuck!ssc!tad@uunet.uu.net (Tad Cook)
Subject: ICOM Batteries (memory)
To: info-hams@ucsd.edu

There have been several postings on here lately about the battery in some ICOM HF radios that holds memory. Some folks fear that the battery will wear out in a few years, and they sill be stuck with a microprocessor controlled radio with no "brains."

I talked to Bill Everett of ICOM today. He said that the batteries in ICOM radios (I'm NOT talking about the battery that POWERS your HT!) have a predicted life of over 15 years. If you want to replace yours before it runs out, and are afraid of losing memory, float a power supply across the battery that is set at about the same voltage as the battery. Then remove the battery, and replace it. Keeping voltage on it will keep the memory alive.

If you want ICOM to do it, you can send in your radio, and for $25 they will replace the battery. This includes parts and labor.

If you want to contact Bill Everett at ICOM, his email address is 76702.753@compuserve.com

He has some trouble replying to internet mail though. Listing a couple of variations of domain addresses could help if you want a reply.

Me, too, but what good is it if everyone does multiple posts? With RARE
exceptions the only time I post an article in two or more newsgroups is in
reply to someone else who did (and I'm therefore uncertain which one he's

actually reading). But some people do it habitually. That would tend to defeat the purpose.

When we say rec.ham-radio.legal, are we including tower cases, etc., or only FCC regulatory matters? If the latter, then rec.ham-radio.fcc might be more descriptive.

Does humour imitate life?

Because of all the "It's illegal" carping of the narrow minded
I and others have suggested that we create wrecked.ham-radio.lawyer
etc. This has been a quiet giggle for the past year or so. In fact,
just for giggles I have even created a newsgroup in my active file
called rec.ham-radio.lawyer.

It is interesting to note that the dull dreary goody-goody
attitude of the narrow minded has lead to the suggestion that they
get their own forum. But at least this will give them an opportunity
to drone on endlessly about matters legal and bureaucratic.

Of all the postings I have made here over the past 18 months,
the one that got the most response was a scenario I fabricated to
excite the armchair lawyers. I invented a scenario where I was on an
auto-patch and someone put me on hold. While on hold, a song and two
ads were played over the repeater. The response to this posting went
on for weeks. If I ask anything slightly technical, it is usually
ignored.

Maybe we should just call this group:
rec.ham-radio.humourless-bureaucrat

Why feed these people? Why don't we ignore them? Let's
treat them with the contempt which they deserve. Giving them a news
group will not stop them posting to rec.ham-radio saying: "Nja-nja,
you can't do that. I'm going to tell the FCC about you."

Some of my most instructive hamming was illegal. Yes, I will even
admit to running illegal phone patches on 2M and 23 cM between Sweden
and Denmark. So I suppose I am now an international felon. I have even
worked Germany, Holland, Belgium, Denmark and England from a
commercial aircraft using a 2M walkie-talkie. So want to know if you
can do this from a plane? Sure you can. Did it crash? Obviously not.
Did I have the captains permission? Well on some these jaunts the
captain (an SM) and I took turns working the rig. But 1,125 posters
here will tell you that the plane will crash and you will go to hell
after you have been to prison.

We now return you to the "You can't do that" postings that clutter
this forum.

P.S. Loved the posting about not being allowed to use radios on
Amtrak. Very funny.

>would be much appreciated--particularly via email so I can see it BEFORE CQWW!
> AA6KX

You have a serious impedance mismatch in the system and are attempting to
compensate for it by introducing reactance by detuning the antennas. This
is the wrong approach. You need to use a section of 75 ohm line a quarter
wavelength long from each antenna to the combined feedpoint. The 75 ohm
quarter wave transmission line transformers will change the 50 ohm base
impedance of each antenna to 100 ohms. Summing the two 100 ohm feedlines
in parallel will result in a feedpoint impedance of 50 ohms. The quarter
wave phasing difference you need for a directional pattern can be obtained
by adding a quarter wave section of 50 ohm line between the end of one
of the 75 ohm transformers and one of the antennas. Tune each antenna
individually for a good 50 ohm match at resonance. There will be some
near field interaction when both antennas are driven. Do not readjust the
the resonant frequency of the antennas. Instead, readjust the base matching
networks to regain a 50 ohm match at each antenna base. Alternately you
can insert RF ammeters in the base of each tower and adjust your matching
networks for equal currents. This is a simplified view of the way we
do it in the broadcast biz.

Subject: rn KILL files
To: info-hams@ucsd.edu

Other rn users may find the following macro useful as an alternative to keeping a global kill file around. The macro causes all unread postings with the same author as the one currently displayed to be marked as read. This gem has been kicking around for awhile and was posted (somewhere, sometime) by dave@Galaxia.Newport.RI.US (David H. Brierley). I've bound it to the ^x (control x) key sequence since rot13 files are a rarity in the groups I read, but you can make the obvious change to bind it to another key. Using it in conjunction with the 'k' command to mark all unread postings with the same *subject line* as the one currently being displayed goes a long way towards preserving my sanity. Just place the following line in a file called .rnmac in your home directory (or add the line if you already have a .rnmac file).

```
^x %(%m=[ap]?/%t/h\:j^J:t)
```

When you encounter this first posting by a known drivel monger, just type ^x. Since the worst offenders usually make *lots* of postings, you often get to watch a long series of 'article nnnnn junked' messages scroll by. Its actually kind of satisying ;-)

Right. Guys in Chicago in the Good Old Days would kill to get Gould to slip their ham callsigns into the Dick Tracy comic strip, which he did regularly.

From: (null)
PROPAGATION FORECAST BULLETIN 47 ARLP047
FROM ED TILTON, W1HDQ
SPRING HILL FL NOVEMBER 19, 1990
TO ALL RADIO AMATEURS

THE SOLAR FLUX WAS DOWN TO 140 ON NOVEMBER 2 BUT IT ROSE RAPIDLY,
REACHING 215 ONLY FIVE DAYS LATER. IT DROPPED BACK TO 186 BY
NOVEMBER 13, BUT RECOVERED QUICKLY AGAIN, RISING TO 223 BY THE 17TH.
THIS WAS THE HIGHEST FLUX READING SINCE THE MIDDLE OF OCTOBER.

TWO LARGE SPOT GROUPS THAT CAME INTO THE EAST LIMB OF THE SUN ON THE
14TH SEEMED TO BE THE MAIN SOURCE OF THE RISE. EARLIER GROUPS THAT
WERE RESPONSIBLE FOR THE 215 PEAK ON THE 7TH DISAPPEARED AROUND THE
WEST LIMB EARLIER IN THE MONTH.

NEITHER OF THE FLUX PEAKS WAS ANYTHING LIKE THE OUTBREAK THAT
PRODUCED THE SURPRISE PEAK OF 315 BACK IN AUGUST, BUT THAT CAME AT
THE WRONG TIME OF YEAR TO DO MUCH GOOD FOR DXERS.

IF THE REST OF NOVEMBER FOLLOWS RECENT MONTHLY TRENDS, WE CAN EXPECT
LOWER FLUX LEVELS THIS WEEK, AND PROBABLY THROUGH THE REST OF THE
MONTH. THIS WOULD HAVE LITTLE EFFECT ON THE MAJOR DX BANDS, BUT IT
MAY SLOW DOWN DX ACTIVITY ON 50 MHZ, AND POSSIBLY 28 MHZ, ESPECIALLY
IN THE LAST DAYS OF THE MONTH.

AMERICAN SUNSPOT NUMBERS FOR NOVEMBER 8 THROUGH 14 WERE 199, 156,
125, 98, 108, 110 AND 115 RESPECTIVELY, WITH A MEAN FIGURE OF 130.1.
SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE
212, 202, 193, 197, 194, 186 AND 201, WITH A MEAN FIGURE OF 198.

I wouldn't go so far as to call the advice BS, somewhat incomplete sure,
but he's on the right track.

>better. But the Yagi still is 20 ohms, and it
>could care less.

Ah, but the Yagi has only one driven element and no phasing harness.
Most of the directional broadcast arrays that I've worked with use L
networks at the base of each tower to match the tower to the 50 ohm

phasing lines and to tune out the reactance caused by mutual coupling.
Some of them also used 75 ohm line sections as their combiner.

If you don't feed the line at it's characteristic impedance, it will
act as a transmission line transformer and really screw up your
combiner and your phasor design. Of course some arrays I've seen used
this fact to advantage in the design of the array, but those systems
were really hard to keep balanced because they removed several of the
adjustments available to compensate for changing ground conductivity
with the change of the seasons. The really good array designs kept the
lines matched unless they delibrately needed an impedance transformation
as part of the combiner. Many of the combiners were adjustable lumped
constant networks however.

The approach outlined by the original poster is sound for a two tower
directional array with the addition of matching L networks at the base
of each tower. Things get a lot hinckier if you have three or more towers
and a complex pattern requirement. In those situations, your towers may
need to be of different heights with special tuning requirements so that
you can get the desired net RF currents to flow in them for the pattern
required. I've even seen arrays with negative power readings in some
of the towers. In fact this is quite common in five tower arrays. But
you still want the coaxial lines matched in their characteristic
impedances. More complex tuning networks are used at the tower bases
to get the desired currents while still presenting a match to the
lines.

Array design and tuning can be quite complex, but to say that one should
ignore SWR in the phasing and combining lines is simply not true.

>One of the worst things that ever happened to ham
>radio is the invention of a cheap means of measuring
>SWR. Far too much attention is paid to it, mostly
>for the wrong reasons.

Any tool can be misused or misunderstood, but cheap SWR meters have been a
boon to those using coax fed antenna systems. The old RF ammeter in the
base of the tower is a good tool, and a vector phasemeter is very useful,
but the good directional wattmeter is a more flexible tool if you understand
what it is telling you and can read a tape measure and a Smith Chart.

I have actually tried this, with varying results:

SRI OM HAD TROUBLE COPYING NO QRM OR QRN, AND UR SIGS FB, BUT
WHAT DOES CCIIOIICOC MEAN?

If they are trying to send too fast, I may ask them to send slower.

Another one that can drive me up the wall is if I am operating CW
mobile, and I hook up with SOMEONEWHORUNSALLTHEWORDSTOGETHER. Very
hard to figure out while driving. I just tell them that I copied
nothing, and to send a little slower with plenty of time between
each word. This problem is especially bad if they can't spell!

The text listed below comes form a flyer found in our local amateur
electronics store in Honolulu. I have copied it as faithfully as
possible (mistakes included). Note that the dashed lines starting
under the word "resistration" indicate that clause was underlined
in the original. Also the word "not" in the sentence with "cram
course" was in bold in the original, not caps as presented here.

@@@@@@@@@@@@@@@@@@@@@@@@ begin flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@

HAM RADIO LICENSE COURSE
presented by
GORDON WEST WB6NOA
JANUARY 17, 19 & 20, 1991
HAWAII YACHT CLUB
OPEN TO ALL

* Pass the Novice-Voice Exam right in class!
* Over 20 hours of Beginner Theory & Code practice.
* No previous in background in Code or Theory required.
* Special marine and ham radio installation and
operation seminar.

Class fee of $150 includes all course materials, consultation with Gordon regarding equipment selection and installation on board your boat, and lunches and refreshments. Pre-study materials will be provided ahead of time, so registration at least 30 days before the course is essential.
==-

Mariners may obtain the amateur radio Novice Class license in just one weekend. Current Novice privileges allow operation on the worldwide voice frequencies on the 10-meter band. Complete instruction in code and theory will be covered. The Novice Class license exam will be given by Volunteer Ham radio operators in the last hour of the course. Many ham radio and electronic demonstrations liven up the weekend and there are opportunities for "hands-on" experience.

This accelerated course is designed to help the student be a good begineer ham operator. This is NOT a cram course. Gordon West will thoroughly cover all FCC element 2 & 1A materials in his fun and humorous style. Multiple test availability assures passing the exam Sunday evening.

* Textbooks, tapes, code key and oscillator and
numerous handouts are supplied free!
* Course fee is $150.

Pre-registration is a must and space is limited! Register NOW at
Hawaii Yacht Club, 1739C Ala Moana Blvd., Honolulu, HI 96815.
(808) 949-4622.

@@@@@@@@@@@@@@@@@@@@@@ end flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@@

I have been a licensed amateur since this summer. My wife just also passed her tech class license. We both studied and learned both the code and the knowledge required to honestly pass the required tests. The "assurance" offered by the above flyer upsets me beyond words. If such an offering is not illegal it certainly must be unethical. I refuse to be convinced that this is proper and ask those who feel my outrage to suggest a course of action. To whom do I write and what should be said? This is now my hobby too, but I am young in the teeth and seek your inputs.

I know what my license is worth to me. Unfortunately, I also now know what it costs.

Best regards, Robert J. Hlivak NH6XO

Subject: QRP on 20 meters
To: info-hams@ucsd.edu

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK,
a 2 watt station on 20 meter SSB. He was using a TH7DX tribander,
but I was still surprised at his signal strength, about S-2. On
my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts.

I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically
on top of us so I had to increase power again... we tried 15 meters but
no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver.
He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run
low power. It sure does help to have a good antenna! Of course,
if we had been on 10 meters, the QSO would have been a lot longer.

This would require a 37.5 ohm quarterwave matching section. 37.5
ohm cable is not off-the-shelf at the local parts house. If instead,
you use two 75 ohm matching sections before the combining junction,
then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-
the-shelf. Sometimes you need to check your design for what parts
are commonly available.

I've often thought about this problem, and I keep running into the
same question. How do you guarantee that the phase shifts through
both matching networks are identical? As you said, the feed point
impedances of the two antennas will probably not be the same, so even
if you used a simple L-network for matching, the phase shifts would
not be identical. Any significant difference in phase shifts will
ruin the pattern of the array.

I wouldn't go so far as to call the advice BS, somewhat incomplete sure,
but he's on the right track.

>better. But the Yagi still is 20 ohms, and it
>could care less.

Ah, but the Yagi has only one driven element and no phasing harness. Most of the directional broadcast arrays that I've worked with use L networks at the base of each tower to match the tower to the 50 ohm phasing lines and to tune out the reactance caused by mutual coupling. Some of them also used 75 ohm line sections as their combiner.

If you don't feed the line at it's characteristic impedance, it will act as a transmission line transformer and really screw up your combiner and your phasor design. Of course some arrays I've seen used this fact to advantage in the design of the array, but those systems were really hard to keep balanced because they removed several of the adjustments available to compensate for changing ground conductivity with the change of the seasons. The really good array designs kept the lines matched unless they delibrately needed an impedance transformation as part of the combiner. Many of the combiners were adjustable lumped constant networks however.

The approach outlined by the original poster is sound for a two tower directional array with the addition of matching L networks at the base of each tower. Things get a lot hinckier if you have three or more towers and a complex pattern requirement. In those situations, your towers may need to be of different heights with special tuning requirements so that you can get the desired net RF currents to flow in them for the pattern required. I've even seen arrays with negative power readings in some of the towers. In fact this is quite common in five tower arrays. But you still want the coaxial lines matched in their characteristic impedances. More complex tuning networks are used at the tower bases to get the desired currents while still presenting a match to the lines.

Array design and tuning can be quite complex, but to say that one should ignore SWR in the phasing and combining lines is simply not true.

>One of the worst things that ever happened to ham
>radio is the invention of a cheap means of measuring
>SWR. Far too much attention is paid to it, mostly
>for the wrong reasons.

Any tool can be misused or misunderstood, but cheap SWR meters have been a boon to those using coax fed antenna systems. The old RF ammeter in the base of the tower is a good tool, and a vector phasemeter is very useful, but the good directional wattmeter is a more flexible tool if you understand what it is telling you and can read a tape measure and a Smith Chart.

The text listed below comes form a flyer found in our local amateur electronics store in Honolulu. I have copied it as faithfully as possible (mistakes included). Note that the dashed lines starting under the word "resistration" indicate that clause was underlined

in the original. Also the word "not" in the sentence with "cram course" was in bold in the original, not caps as presented here.

@@@@@@@@@@@@@@@@@@@@@@ begin flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@@@

HAM RADIO LICENSE COURSE
presented by
GORDON WEST WB6NOA
JANUARY 17, 19 & 20, 1991
HAWAII YACHT CLUB
OPEN TO ALL
* Pass the Novice-Voice Exam right in class!
* Over 20 hours of Beginner Theory & Code practice.
* No previous in background in Code or Theory required.
* Special marine and ham radio installation and
operation seminar.

Class fee of $150 includes all course materials, consultation with Gordon regarding equipment selection and installation on board your boat, and lunches and refreshments. Pre-study materials will be provided ahead of time, so registration at least 30 days before the course is essential.
===-

Mariners may obtain the amateur radio Novice Class license in just one weekend. Current Novice privileges allow operation on the worldwide voice frequencies on the 10-meter band. Complete instruction in code and theory will be covered. The Novice Class license exam will be given by Volunteer Ham radio operators in the last hour of the course. Many ham radio and electronic demonstrations liven up the weekend and there are opportunities for "hands-on" experience.

This accelerated course is designed to help the student be a good begineer ham operator. This is NOT a cram course. Gordon West will thoroughly cover all FCC element 2 & 1A materials in his fun and humorous style. Multiple test availability assures passing the exam Sunday evening.

* Textbooks, tapes, code key and oscillator and
numerous handouts are supplied free!
* Course fee is $150.

Pre-registration is a must and space is limited! Register NOW at
Hawaii Yacht Club, 1739C Ala Moana Blvd., Honolulu, HI 96815.
(808) 949-4622.

@@@@@@@@@@@@@@@@@@@@@@ end flyer text @@@@@@@@@@@@@@@@@@@@@@@@@@@@@@

I have been a licensed amateur since this summer. My wife just also passed her tech class license. We both studied and learned both the code and the knowledge required to honestly pass the required tests. The "assurance" offered by the above flyer upsets me beyond words. If such an offering is not illegal it certainly must be unethical. I refuse to be convinced that this is proper and ask those who feel my outrage to suggest a course of action. To whom do I write

and what should be said? This is now my hobby too, but I am young
in the teeth and seek your inputs.

I know what my license is worth to me. Unfortunately, I also now
know what it costs.

Best regards, Robert J. Hlivak NH6XO

Where do you get off assuming this sort of nonsense? I am infavor of
such a group, and I LOVE controversy.

>Come on folks, let's not become too stultified. Sure, the code-no code
^^^^^^^^^^
That's why were trying to move the never ending, no new ideas circular
discussions to another group.

>discussion seems unending. So what? I would really prefer to exclude all the
>mentalities that are horrified ("bored") by controversy. Reasoned arguments

Once again, you seem to be a bit confused about motives, and perfectly willing
to make ad-hominem attacks on those who support this idea. If this is your
idea of controversy, bug off.

>are the spice of life. Even the Russians are able to disagree now without
>being sent to Siberia!

Yep - so let's hear some of your reasons, rather than just ad-hominem
flaming, OK?

By the way - next time you see an original thought in the code/no-code
debate, why not let us know? I haven't seen one in a long time.

Subject: QRP on 20 meters
To: info-hams@ucsd.edu

Last night at 0620 UTC (8:20 pm local time) I worked JA1WVK,
a 2 watt station on 20 meter SSB. He was using a TH7DX tribander,
but I was still surprised at his signal strength, about S-2. On
my end I'm using just a G5RV dipole (3/2 wave) at 100 feet, and 100 watts.
I also tried reducing power, and he could hear me at the 1 watt level.

Naturally, after 5 minutes or so at QRP some LID came up practically
on top of us so I had to increase power again... we tried 15 meters but
no contact was made.

For the curious, Yoshi's rig was a Mizuho MX14S monoband transceiver.
He had a similar monobander for 15 meters.

The moral of the story is: Even on DX alley of 20 meters you can run
low power. It sure does help to have a good antenna! Of course,
if we had been on 10 meters, the QSO would have been a lot longer.

This would require a 37.5 ohm quarterwave matching section. 37.5
ohm cable is not off-the-shelf at the local parts house. If instead,
you use two 75 ohm matching sections before the combining junction,
then two 100 ohm loads in parallel equal 50 ohms. CATV cable is off-
the-shelf. Sometimes you need to check your design for what parts
are commonly available.

I've often thought about this problem, and I keep running into the
same question. How do you guarantee that the phase shifts through
both matching networks are identical? As you said, the feed point
impedances of the two antennas will probably not be the same, so even
if you used a simple L-network for matching, the phase shifts would
not be identical. Any significant difference in phase shifts will
ruin the pattern of the array.

>hypercard test me over and over again helped me realize where I needed more
>studying (and helped me with the famous exam nerves syndrome.)

Early in 1990, I set out to complete my New Year's resolution of obtaining my
novice and tech license. I went about 2/3 of the way through a class taught
by the Stanford amateur radio club, but never took the test. Then a little
over a week ago, I found the HyperCard stacks on apple.com (ftp), and decided
to go for it once again. I had forgotten almost all of the code I learned at
Stanford, but with the Mac "Morse" program, and the HyperCard stacks, I really
studied intensely for five days (though my four years studying Electrical Eng-
ineering did help too), and last Sunday I took the Novice written test (missed
two questions), and the Tech written test (perfect score) and the code test
(perfect score). Sure was a hell of a lot easier with the Mac rather than
reading the boring books...

>So, Diana, for all of us: Thanks so much!!!

I second that whole-heartedly! One minor thing: The stacks I have don't
have any version number (I retrieved them a few weeks ago from apple.com)
in them, but they did seem to have some problems occassionally - they would
stop in the middle of a test and tell me (on the summary page) that I had
missed all of the remaining questions. Strange. Oh well, I passed anyway!

SB RTTYDX @ RTTYDX $RTDX1123
RTTY DX Notes 1of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123
Part 1 of 3.

One wonders where the art of communications has gone to? Over the
past week I have been looking at the mini mailboxes. I Saw 43 of
them. Are they all small sized PK232s? It seems that with the
proliferation of these units it will soon be impossible to find a
space to have a QSO. I think that an original idea that was put
forward would be a viable answer. All mailboxes (including mini
mailboxes) be shifted to 10 and 18 MHz. That would be a logical
answer. Use those frequencies, or lose them.

Our thanks this week go to DJ3IW and the Saar-Pfalz-DX-Club Packet
Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, N2HOS, OD5NG, TG9VT, VK2EG,
W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for
your very welcome information and help.

RTTY DX Notes 3of3 11/23/90

RTTY DX Notes for week ending 23rd November 1990
BID: $RTDX1123B
Part 3 of 3.

QSL Information:

UC2OCJ says to QSL via Box 68, Gomel. 246027 Buelrussia, USSR.

9X5LJ and 9X5AB request their cards be sent to Box 81, Kigali, Rwanda.

UH8EA collects his cards from W5BWA.

5N0ETP collects his cards via N6LQL.

9Q5TE has SM0BFJ as his QSL manager.

CE0ZZZ says to QSL to Box 13312 Santiago, Chile.

Notes of Interest:

JA3DLE/1 reports that JG1RVN will be QRV from XU for 6 days from 3rd to 9th December with lots of RTTY.

On 27th November, or around that date, (after the CW contest), N7NG, OH2BH, OH2RF, and ZS6BCR will operate from Penguin Island (off the coast of Namibia) for 6 days by special permission of the South African Nature and Conservation people. The callsign could be ZS9Z/ZS1, after which they will operate from Walvis Bay with the callsign of ZS9Z for 4 days. They will use Icom gear and the QSLS go to OH2BH.

3W3RR is still hopeful of operating from Spratley in December.

Kure Island (KH7) is scheduled for December 12-21, all bands including 6 meters, if they can find some gear and aerials for 6. If you can help, call 671-346-2201 (in Guam) after 0600Z. Prefixes may be KH7/AH7/WH7 for the prefix hunters. The basic callsign will be KD7P/NH7.

SP5FYM is headed for King George Island (Antarctica) for January 1991.

There is a plan to activate 'MV' Island (in the Gulf of Finland) in
March 1991. They require RTTY gear. More later.

GL DE DX1 (VK2SG).

3363. AMSAT orbital data format

Newsgroup: rec.ham-radio
Date: 1990-11-24 18:22:33 UTC
From: LSPRINGSTEEN@WSMR-SIMTEL20.ARMY.MIL
Message-ID: <12640522248.27.LSPRINGSTEEN@WSMR-SIMTEL20.ARMY.MIL>
Source record: 6272

RE:AMSAT ELEMENT SETS

GREETINGS ALL,
I have been wondering WHY the good people at AMSAT insists on publishing orbital element data in an archaic and expanded format. I have been relaying AMSAT BN's from KT7H @ N7HFZ.WA.USA.NA for a few months. I do not understand the logic of sending data that takes up twice the space and requires manual input to be used. I also copy the data posted by T.S. Kelso and send out the orbital data on the local VHF Packet network. I have compared the size of the two formats and it's close to a two to one ratio with the same data in different formats. AMSAT BN's sent:

Satellite: AO-10
Catalog number: 14129
Epoch time: 90311.38885312
Element set: 621
Inclination: 26.0154 deg
RA of node: 176.3254 deg
Eccentricity: 0.5958797
Arg of perigee: 190.4011 deg
Mean anomaly: 147.4868 deg
Mean motion: 2.05880027 rev/day
Decay rate: 1.30e-07 rev/day^2
Epoch rev: 2768

T.S. Kelso sent the following:
OSCAR 10
1 14129U 83 58 B 90311.38885312 .00000013 00000-0 00000 0 0 6218
2 14129 26.0154 176.3254 5958797 190.4011 147.4868 2.05880027 27684

It's the same data only in half the space. Is there any one that reads this net that knows who to talk to to fix this problem? I see this expanded format floating through the BBS's on packet taking up space. I could cut and paste the short data into the AMSAT BN's if I can't get AMSAT to change. Nobody locally uses the expanded stuff. Any one with a better idea on how to handle this problem post or e-mail me.

Bye for now, 73

* I noticed a similar article in the Los Angeles Times. It was
* attributed to United Press International. Do you suppose UPI treats
* the Usenet as an incoming newsfeed?
*
* Craig Milo Rogers

In the Denver Post, the` byline is the Associated Press. It summarizes
for the unwashed public what Ted reported to the net and interviewed
Billie Deason, NASA Spokeswoman.

3365. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-11-24 22:17:33 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9011242217.AA25512@blackbird.afit.af.mil>
Source record: 6274

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Ham Radio Tranceiver For Sale

One Kenwood TS-140S, HF 100W transceiver.

Excellent condition, only problem is that the hexnut on the tuner knob
is stripped (a new one costs about $10 direct from Kenwood..).

This rig cost me $1100 when new, it has very little air time, and I
wouldn't sell it except I am getting a new apartment and I really need
the $$$.

I will accept any offer over $800.

Note that the spacecraft was in eclipse when this telemetry sample was taken (actual location was off the east coast of New Jersey). Also note that the 24-hour UTC clock is one hour slow.

By the way, the software that performed this telemetry analysis was written in 'C' and was compiled and run on a Commodore 64 computer (!!).

3372. Uniden HR2600 on VHF/UHF

Newsgroup: rec.ham-radio
Date: 1990-11-25 04:01:05 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <375@ka2qhd.UUCP>
Source record: 6387

Hello Folks!

I recently purchased a Uniden HR2600 and a Microwave Modules MMT 144/28
2-meter linear transverter and got both interfaced and working well.
The HR2600 has an output power of 25 watts PEP on SSB, CW and 10 watts on
AM and FM. The transverter requires only 0.25 to 25 mW of 28 MHz drive for
proper operation. In an effort to reduce the HR2600 output level to the
level required by the transverter, I removed PB-100, a small double-sided
copper coated circuit board located under the top cover that supplies +Vcc
to the driver and final amplifier stages. I then soldered a jumper between
TP2 and TP4, the outermost prongs that hold PB-100 in place.

This action provides the HR2600 driver with full +Vcc, but removes +Vcc
from the MRF 477 final power amplifier. There is more than enough driver
energy fed through the final to excite the transverter in this configuration.

I've received good signal and audio reports from all the locals when using
the transverter and the HR2600 with this simple modification. I believe this
modification could make the HR2600 useable with other transverters as well.

73 and Good DX! de John, KD2BD

3373. Curing Grappler Box RFI

Newsgroup: rec.ham-radio
Date: 1990-11-25 06:47:53 UTC
From: bote@csense.uucp
Message-ID: <1990Nov25.064753.186@csense.uucp>
Source record: 6377
Cross-posted to: sci.electronics,rec.ham-radio

Has anyone had any success in reducing the incredibly
high amount of RF radiated from their Grappler box?

My housemate has one hooked to a Mac and the thing makes most
of the frequencies in my scanner and ham equipment useless,
throwing birdies out all over the place.

I tore it apart with the intent of hanging capacitors
everywhere, but they actually bothered to do some
filtering at the factory. I added a 0.047uF across
the output terminals of the 7805 voltage regulator
for good measure, but the source of the interference
is the execution of the on-board Z8's program.

Please email responses since my feed and my news partition
don't feel well. The clock starts ticking now; if
there is no cure, I'm tempted to Grapple the thing
into the ocean!

I read in the latest Sweden Calling Dxers that
Sweden was thinking about using a part of the fm band for digital audio
broadcasting. I am interested in knowing information regarding
this mode. Any technical information would be appreciated.
I know that the Ebu. is looking into such a system and it is being looked
at here in the Usa. as well. Any info would be appreciated.

3375. Radios in _Memphis Belle_ (SPOILER!)

Newsgroup: rec.ham-radio
Date: 1990-11-25 18:05:47 UTC
From: pschleck@ALF.UNOMAHA.EDU
Message-ID: <9011251805.AA19268@alf.unomaha.edu>
Source record: 6388

Newsgroups: rec.ham-radio, rec.radio.shortwave
Summary: Review of technical aspects of _Memphis Belle_
Keywords: B-17,Memphis,Belle,SPOILER

WARNING: The following post is a SPOILER, so if you haven't seen the movie and want to see it fresh, abort this post now....

LAST WARNING......

TOO LATE!

"Command Set" junkies will like the racks of 'em mounted on the B-17's in Memphis Belle. Also prominent were B-voltage batteries, J-73 straight keys, etc. Somewhat amusing was the conversation between the radio operators of 2 bombers on the way to the target in Germany. The rookie operator was unsure of what to log and radioed the experienced one for help. "Just log everything, when you get more practice you'll know what to leave out." is a rough paraphrase of the answer. I'm sure there are those of us who could benefit from such advice. :-)

I have a hunch that if that conversation actually took place, it was in telegraphy (if I say the 2-letter abbreviation, it won't make it through the kill files of SOME users). The use of phone was probably for the movie audience's benefit. Any older radio op's wanna confirm/deny this?

When the German fighter sliced through the tail section of the rookie plane and their screams go out over the air to be picked up by the entire group, their signal fades into something that sounds like a dead ringer for HF weather fax. Seems the sound crew used the wrong FX for static! This is the ONLY slip-up, though.

It's refreshing to see a film that is technically accurate and believable, particularly since this one didn't break the bank like MIDWAY, which ventured to be accurate in EVERYTHING (including the >A1A<, I'm running out of synonyms! :-). I suspect the Confederate Air Force provided the planes, communications gear and all. Anyone in the CAF want to comment on the radio part of these plane's restoration and maintenance? Were those modern antennas/sensors that I saw on some of the planes in the movie to meet contemporary FAA regulations? Just curious.....

Considering the yacht clubs with crooked VE's who pass out licenses willy nilly, I'd say those taking the West course are a real step up. I truly can't fathom why anyone would object to novice training seminars - unless it's to maintain the illusion the becoming a ham is somehow mystical and a mighty deed only a few magic people can accomplish.

3378. FOR SALE: Shure 444D and Hustler 4-BTV

Newsgroup: rec.ham-radio
Date: 1990-11-25 18:38:43 UTC
From: GRAY_S@DICKINSN.BITNET
Message-ID: <9011251940.AA29147@ucsd.edu>
Source record: 6390

I've got the following items for sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

BTW, the reason for the sale is that it appears I will be spending a good deal of time away from home over the next 2 years. Anybody know of a *hot* 10 meter mag-mount antenna? Doesn't Wilson make something that works well?

Thanks for reading!

3379. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-11-25 22:27:58 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901125152758.20402fcb@HG.ULeth.CA>
Source record: 6392

/\/\/\

between 13:46 UT and 13:49 UT on 18 November. The estimated shock velocity was 1,000 km/sec. No terrestrial impacts occurred from this event.

Region 6368 has continued a very gradual decay since 20 November, maintaining a complex delta configuration in the trailing spot group. It has also continued frequent subflaring with modest amounts of C-class flaring. M-class flares have dropped in frequency since 20 November.

Region 6377 (S04W01) has developed rapidly over the past 24 hours and managed to produce a healthy class M3.1/1B Tenflare at 14:25 UT on 24 November. Other minor discrete radio emissions were observed from this flare. The location of this flare was at S04E04. It lasted 57 minutes, ending at 15:09 UT on 24 November. Region 6368 also managed to produce a class M1.2/SF flare at 23:46 UT on 24 November. Both of these flares produced a SID/SWF.

Geomagnetic activity was unexpectedly low this week. Activity was predicted to be unsettled to active, but maintained almost exclusively quiet conditions throughout the week. Effects from a coronal hole never materialized. As well, predicted solar activity never reached anticipated levels and thus did not produce expected terrestrial impacts.

Auroral activity likewise did not reach anticipated levels. Auroral activity was not visible at middle and low latitudes. Some higher latitudes spotted moderate auroral activity on 18 November, but activity dwindled as the week progressed.

Radio propagation conditions were normal to above normal this week. Relatively strong and stable signals occurred throughout the week at low and middle latitudes due to the unexpectedly quiet geomagnetic and auroral activity. Some increased levels of noise were evident on 18 November due to subsiding geomagnetic activity over higher latitudes. There were numerous short wave fades (SWFs) throughout the week, all attributed to the M-class flare activity from Region 6368. None of the SWF's were intense. The majority of frequencies affected were below 10 MHz. It is not known whether the SWF's were accompanied by VHF enhancements. Ionization levels were likely not high enough to produce any significant VHF signal enhancements, although there were probably localized area's of enhanced sporadic E during these periods.

As of 25 November, two additional SID/SWF's were observed. The first began at 14:12 UT and ended at 15:05 UT on 24 November. The second began at 23:30 UT and ended at 00:31 UT on 25 November. Both of these events were of low to moderate intensity and were flare-related.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain mostly low with the possibility for occassional M-class flaring from departing Region 6368 and Region 6377. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA and proton events. Region 6368 continues to sport a Beta-Gamma-Delta magnetic configuration with particular delta complexity in the trailer spot group. Probability for a major class X flare is stationary at 10% over the next two days, dropping to 5% on 27 November with the passage

of Region 6368 beyond the west limb. There is a 5% probability of a major proton flare from this region. Although these probabilities are low, they warrant attention. The solar flux is expected to drop quite dramatically with the passage of Region 6368 beyond the west limb on 26 and 27 November.

Geomagnetic activity is expected to remain mostly quiet until 26 November when models suggest activity should increase to unsettled levels over all latitudes with a risk of active periods over middle and high latitude regions. No significant activity or storming is expected, however. Conditions should return to quiet to unsettled levels by 28 November.

Auroral activity will be dormant until near 26 November when some increase in activity may occur. Activity will remain confined to the high latitude regions where it is expected to be mostly of low intensity with possible bursts of moderate activity. Auroral activity is then expected to decline to non-visible levels on 27/28 November and remain quiet throughout the remainder of the week.

HF radio propagation conditions should be quite good this week, with only a slight increase in noise and flutter expected near 26/27 November. The expected increase in geomagnetic and auroral activity should not have much of an impact on HF radio communications. So with the exception of 26 and 27 November, HF communications should be above normal on most of the other days this week. Sporadic degraded HF propagation is possible on the sunlit side of the earth due to expected persisting SIDs/SWFs caused by minor solar flaring.

VHF radio propagation should remain normal this week. There is the potential for sporadic DX contacts during SID periods which are expected to occur on the sunlit hemisphere of the earth this week due to minor flaring from departing Region 6368 and Region 6377. Other than these slight possibilities, conditions will not be sufficient to provide widespread DX opportunities this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 25 NOVEMBER

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

>this news group. Of course I like hot and spicy Mexican food also and
>I realize there are lots of people who don't get much past milk and
>cookies :-)

My 2 cents:

I like spicy Mexican food as much or more than the next person. But
if you eat it all the time, it becomes as dull as anything else -- which
rec.ham.endless-cw-debate certainly has.

As regards skipping the continuous flamage: IMHO, it would be
helpful if flames were more frequently designated as such (which was a
convention I first read about in the BITNET literature when I started using
the net). Maybe I've just missed it, but I haven't seen this used often.
If the conference is kept as is -- and I can understand the reasons for
doing so -- dealing with frequent flamage might be bearable if more folks
did this.

Thanks.

3381. Re: IC-32AT Mod for out of band transmit

Newsgroup: rec.ham-radio
Date: 1990-11-25 23:27:57 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1990Nov25.232757.18099@ux1.cso.uiuc.edu>
Source record: 6391

pbhx@ellis.uchicago.edu (Peter B. Hayward) writes:
>I have the instructions for the mod to allow out of band
>transmit for the 32AT, but I wondered if there was anyone here
>who had done it. I would like to learn of your experience before
>I go ahead.

I have done it. I found that the suggested points to wire in the two diodes were awfully small and close to some surface mount parts compared to a couple other points a few mm's toward the top of the radio that I discovered by tracing the foil lines. I double checked to make sure that they were correct by:

1. Comparing the lines on the actual board to the lines on the board diagram in the service manual.

2. Following the lines to other components and comparing that to the schematic.

I then wired the two diodes from a common point I also traced to on the lower right, which was big enough for the twisted common end of the two diodes. The other ends went to the two other points I first mentioned.

These two diodes enable out of band transmit for each band separately, though I never determined which was which. If you do not want the out of band transmit, don't bother with these diodes.

I used the "switching diodes" Radio Shack sells.

I put insulation on the diode leads by stripping some off some large gauge wire first. Ordinary loose insulation is too big. This allowed me to keep everything as flat as possible.

The other mods call for cutting diodes in the lower right of the board, and I cut only ONE END of each, and put some insulation over the cut end with excess hanging on to prevent recontact.

I chose NOT to make the cut to enable 10 MHz frequency entry (personal preference).

>(Yes, yes, I know this is all wrong, type-accepted radios, etc.,
>but I want to have a backup to my marine radio in case it goes
>out just when I need it -- as it did once.)

It's too bad that when some people know that certain things are wrong, they go off and start telling you that OTHER things are wrong as well. Some people cannot even tell the difference sometimes. It depends on the question asked. I have never seen a law (and I looked for it) that makes it illegal to make these mods or to have such a modified radio.

There are some laws that make its use for many things illegal, but some people take that as liberty to claim other things to be illegal as well. Double check any such posting to see if the answer is one for the question you are asking, or if they are just answering the question they wished was asked.

plb@dcdwest.uucp (Phil Blais) writes:

>Come on people, variety is the spice of life as they say, if you don't
>like a certain topic theres always the 'n' key, rn macros, kill files

Can we get off this 'n' key crap? Some people don't like to have to
keep pressing this key time and time again. It is too easy to just SAY
that there is such a key, but when you add up the time it takes to
display the next posting, and the number of postings someone does not
want to read, day after day, this really starts to add up in terms of
time spent reading, or specifically NOT reading.

Not everyone is skilled at writing macros. If you want to offer a
service to these people to do so, then please post your offer and
then more people can take advantage of the feature. The same goes
for kill files.

>etc. etc. I for one don't believe there is any need to further fragment
>this news group. Of course I like hot and spicy Mexican food also and
>I realize there are lots of people who don't get much past milk and
>cookies :-)

Some people even get beyond that: Chinese, Indian, Thai, Indonesion,
and many more.

3383. where to find 559 RADIO related files for anonymous FTP

Newsgroup: rec.ham-radio
Date: 1990-11-26 00:39:00 UTC
From: Phil_Howard_Kawgn@f110.n771.z3.fidonet.org
Message-ID: <9011272035.AA9259@f170.n771.z3.fidonet.org>
Source record: 6384

From: phil@ux1.cso.uiuc.edu (Phil Howard KA9WGN)
Keywords: radio ftp
Lines: 569
Organization: University of Illinois at Urbana

These are files that matched "radio" in their pathnames. There were 559
files
that matched. This is not a guarantee that the files actually are related
toham radio or shortwave radio.

(there are 559 files listed)

3384. where to find 559 RADIO related files for anonymous FTP

Newsgroup: rec.ham-radio
Date: 1990-11-26 00:39:38 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1990Nov26.003938.27001@ux1.cso.uiuc.edu>
Source record: 6417
Cross-posted to: rec.ham-radio,rec.radio.shortwave

These are files that matched "radio" in their pathnames. There were 559 files
that matched. This is not a guarantee that the files actually are related to
ham radio or shortwave radio.

(there are 559 files listed)

3385. Re: ICOM Batteries (memory)

Newsgroup: rec.ham-radio
Date: 1990-11-26 00:55:47 UTC
From: pgc@csadfa.cs.adfa.oz.au
Message-ID: <2088@ccadfa.adfa.oz.au>
Source record: 6422

I have been following the discussion of the story of batteries and Icom gear with interest.

Does anyone know if the ICOM IC735 needs reporogramming if the battery dies?

My manual does not mention anything about this, it only says to replace it if the display goes crazy.

Please email replies to me. Thanks in advance.

Ponder this folks.
We (amateur radio folk) have allocated bands from 10.0 Ghz to 10.5 GHz
and from 24.00 to 24.25 Ghz.
Additional note
Radar detector bandwidth is generally somewhere in the 100 Mhz range
ok
now we put 2 and 2 together
Since the allocation for X Band (10Ghz) falls within the 100 Mhz bandwidth
centered on 10.525 Ghz for police radar
and the K band allocation is right in the middle of our band
incidently this K band freq is 24.15 Ghz
Who is to say that the radar detectors, which can easily be a reception device
for cw are illegal for amateurs to use in any state?

You might comment to me if you have some other ideas about it.

HOWDY!

This is just a reminder that the Texas A&M University ARC will be running
a special events station during the afternoon and early evening of
November 29, 1990--That's right, this Thursday.
It will be commemorating the 80th burning of the Fightin' Texas Aggie
Bonfire. Look for us in the Novice/tech portion of the 10m band or on
the 146.82 pl 88.5 repeater here in College Station.
We will also allow skeds to be made up until about 5-6pm on the following bands:
80m, 40m, 30m, 20m, 17m, 15m, 12.5m, 10m, 6m, 2m, 70cm
By next year, we should be able to conduct station with 160m and 3cm also.

A certificate shall be awarded to each station that a contact is made with
via a SASE. Listen to CQ Bonfire for qsl information and envelope size info.
The call used will be the Texas A&M ARC call--W5AC

If you need more info or would like to set up a non 10m sked, please contact
us in one of the following ways.

Thanks
73

3388. MONTHLY SOLAR TERRESTRIAL REVIEW

Newsgroup: rec.ham-radio
Date: 1990-11-26 01:50:06 UTC

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---
October 1990

Report Issued In-Part from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK NOVEMBER 1990 - MAY 1991

We are now in month 50 of solar cycle 22. Averaged activity levels and solar indices were up again in October compared to September, but not nearly enough to affect the prediction that July 1989 was in fact the solar maximum of cycle 22. The largest increase was observed in daily sunspot number and the monthly average was up almost 33 points over September values. The prediction model used for smoothed sunspot number shows that there is still a slight statistical possibility that solar maximum is yet to come. However, for this to be true, the activity and solar indices would have to reach the levels obtained in August 1990 and maintain that level for a number of months. If time proves July to be just a relative peak of activity and not the solar maximum, then the regression model predicts late spring 1991 as the next probably candidate. However, at this time we do not see any indication of the kinds of activity that would be necessary to unseat July 1989 as solar maximum of cycle 22.

Flare activity ranged from low to high during October. There were a total of eleven M-class flares reported during the month. The two largest, an M8/1N Tenflare at 18:06 UT on 20 October and an M3/SF at 06:02 UT on 21 October, originated from Region 6311 which became quite active on 20-21 October, producing three M-class flares before it crossed the limb late on the 21st. There was a very slight proton enhancement at satellite altitudes which began around 09:00 UT on 23 October, reached a maximum of 4 pfu at the >10 MeV range at 14:25 UT on 23 October, and lasted about 36 hours. Although no solar event can be pinpointed as the cause of this proton enhancement, its signature suggests that it originated as an east limb event.

Geomagnetic activity ranged from quiet to minor storm levels at mid latitudes and quiet to severe storm levels at high latitudes. The two most disturbed days were 10-11 October when mid latitudes experienced minor storm conditions and high latitudes experienced one day of severe storm and one day of major storm conditions. Although no individual event can be suggested as responsible for this activity, it is possible that the interplanetary magnetic field was aligned southward, allowing solar wind energy to be passed efficiently to the magnetosphere, in essence, enhancing the effects of earlier solar disturbances.

Radio propagation conditions during the month ranged from very poor levels at high latitudes to very good levels at low latitudes. The most disturbed period occurred in conjunction with the minor geomagnetic storm of 10-11 October. Significant auroral flutter and fading caused poor HF propagation over most paths.

SIX MONTH SOLAR CYCLE OUTLOOK

Prediction models indicate another small increase in the raw solar indices for November, still not enough to affect July 1989 as solar maximum. A drop in December and a leveling off through the first couple of months of the new year are also predicted. No great deviation from the activity levels of the last two months are foreseen at this time.

Radio propagation conditions over the next six months look relatively good. No significant changes in overall conditions are expected, excluding the normal seasonal variations. Approximately one minor to major geomagnetic storm can be expected every month or two. Therefore, between 3 to 5 significant periods of degraded propagation conditions should be anticipated over the next six months, provided current models are accurate in predicting pulses of solar activity and recurrent phenomena.

The occurrence of SIDs/SWFs should persist throughout the next six months. Present solar models suggest that December through January will likely be the least productive months in terms of solar flare and SID/SWF activity. Also, a decline in MUF is anticipated for December and the first part of the new year, coinciding with decreased levels of ionospheric ionization.
